1. Hi everybody

Yahoo group: GPSL (2002 — 2008)
Date: 2002-05-03 04:04:43 UTC
From: Mark Conner
Topic: 1 Message: 1

Just wanted to say hi to every and start the list discussion.

First thing we should get a handle on is what sort of payloads are available that people want to fly. I'll start off.....

NSTAR can fly a combination of the following:

1) Primary APRS: 2m only, VFO, time slot capable
2) Backup APRS: 2m or 70cm, VFO, time slot capable
3) Simplex repeater: 2m or 70cm, VFO
4) Cross-band repeater (W0RPK's): 70cm up/2m down or vice versa, VFO, APRS MIM on downlink, data not slotted
5) Camcorder: VHS-C, 2 hour of video, manually started before launch
6) Still camera (maybe, awaiting time to modify and test)

My preference is to fly 1, 2, and 5. I think 1, 4, and 5 is too much weight, but I'll figure that out soon. If someone else flies a camcorder, I could do 1 and 4. 6 will fly with 1 if it's ready regardless.

If the others can chime in here, we'll get on our way.

Topic: 3 Message: 3

I need to know if presenters will have written notes for me to publish. So far no presenter has given me notice. I'd like to make a copy of every presenter's notes available to attendees. I'll take care of the photocopying and binding.

Please let me know if you'll have notes for me to publish.

Paul

4. Frequency Plan

Yahoo group: GPSL (2002 — 2008)
Date: 2002-05-12 04:48:18 UTC
From: kd7lmo
Topic: 4 Message: 4

Because of the number of balloon launching from GPSL and possible interference with local repeaters, I've started to put together a frequency plan. The list is posted in the files section. I will be happy to maintain it and add other groups to the list. So far I've added our group, ANSR - Arizona Near Space Research.

We will fly a cross band repeater that can be used by the tracking teams.

5. Frequency Coordination

Yahoo group: GPSL (2002 — 2008)
Date: 2002-05-13 17:47:34 UTC
From: paul.verhage@boiseschools.org
Topic: 5 Message: 5

Packet, ATV, and Repeaters, Oh My!

It looks like we're going to have more transmissions coming out of Manhattan on 6 July than NSA HQ. To prevent near space capsules from stepping on each other, we'll start a table of frequencies, powers, times, and modes.

I'll need a coordinator to keep track of this. Mark, can you do that? All communications about this topic are to be sent to the list. Once the table is put together, it will go out to subscribers for their review. Please don't make comments about selected frequencies until after the final table it put together and emailed. After that, please look them over and look for potential problems.

To all program managers,
Please email current transmission information to gpsl@egroups.com in this format.

Subject line for email: Frequency Plan

Please organize the text of your message as follows.

Program or capsule name
Mode Power Frequency Time

For example,

TVNSP
Packet 340mW 144.390 0, 15, 30, and 45 seconds

If you're flying a dual-band repeater, please post both frequencies and indicate which is the uplink and downlink frequency.

In Manhattan, there's not a lot of APRS traffic. Unfortunately, not long after we launch, we'll run into traffic from KC. In KC there's lots of APRS traffic. So GPSL will move off the standard APRS frequency (144.390). Mark suggested a frequency, but I managed to lose it. I'll get back with you on the proper APRS frequency.

Chase Frequencies
At the launch site and for what I think will be most of the chase, we'll use the Manhattan repeater. If we get close to Topeka or Lawrence, we'll switch to one of their repeaters. A near space repeater will be avaiable during the chase. We may go to simplex during portions of the recovery. I'll post the Topeka and Lawrence frequencies shortly. For simplex, I'd like select a 2m and 440 frequency that are easy to remember, perhaps the call-in frequencies. Those too will be posted shortly.

Thanks,
Paul

Paul,

Not sure if you saw my message from last week, but I already started
the frequency list. It is posted in the Files sections. If you want
Mark to track the frequencies, let me know and I'll assign the file
to him.

Topic: 5 Message: 7

I can keep track of the various modes, frequencies, etc. I've gotten some input from Mike KD0FW off-list for his payload(s). I looked at KD7LMO's inputs in the files area.

I had previously suggested everyone having a slotted beacon on 144.34 MHz for mutual chase support if possible.

Also, when people submit their inputs, please indicate if you're frequency-agile and to what extent (crystalled, VFO 70cm only, VFO 2/70, etc). That will help us decide how much people can compromise on their "favorite" frequencies should we need to make adjustments.

I'm not sure if the egroups.com address will work - if not, the correct address is gpsl@yahoogroups.com.

10. Frequency Coordination Format

Yahoo group: GPSL (2002 — 2008)
Date: 2002-05-13 19:08:02 UTC
From: paul.verhage@boiseschools.org
Topic: 5 Message: 10

One o more item needs to be added to the frequency coordination form. Please add if you can change frequencies and how easy. This won't be a problem for APRS, as we'll use the same frequency. But repeaters and ATVer's can't use the same frequency. We won't ask someone to change frequencies if their transmitter is crystal controlled and can't be changed in time.

So the format looks like this....

Name Mode Power Frequency Changeable?

Options for Changeable are

Yes (as in having an HT with a tuning knob)
Some (as in using a crystal that you can reasonably switch out)
Not on your life (there's no realistic way to change your frequency in the time allotted)

Paul

Paul,

A less than timely response. My intent is to use our records listing as the backbone of my discussion paper. I will add my comments to each category and encourage attendees to contribute their thoughts during the discussion. The paper will then be amended with contributions from others and published in my web pages for the amusement and amazement of both of my readers . . .

I will cooperate with your schedule to make the initial paper available for a printed proceedings. Given electronic copies of other papers, I could also (as I say in our GPSL web page) create a more comprehensive web proceedings to be available to all comers (both of them) . . .

17. 500 mile flight?

Yahoo group: GPSL (2002 — 2008)
Date: 2002-05-16 16:39:17 UTC
From: K. Mark Caviezel
Topic: 17 Message: 17

All:
It's been an idea of mine to launch a zero-pressure balloon from here in Denver, and float it low (30-40k feet probably) from here to Manhattan KS, about 500 miles east of here. I keep bringing it up at the EOSS meetings, but the idea just hasn't caught on. Some rudimentary navigation could be possible with ballast dump. If anyone on this list wants to assist in looking at historical winds and coming up with a flight plan (something like- float at A feet until you get to X,Y, then dump ballast and ascend to B feet to take the balloon into the Manhattan KS vicinity), I would take this info into account to design and build the balloon and flight systems. If the 'cruise float' is around 30k feet, I should be able to maintain direct line of site control over the balloon to 300+ miles out if I drive up to 14+k feet on Mount Evans (or Pike's Peak) immediately after launch, then do a hand-over to a team on the ground in Manhattan.

Any interest ?

I like the idea.
I assume recovery crews here would send a series of DTMF tones
to terminate the flight?

One concern is the altitude of the flight. 30-40k feet will keep the
balloon in the jetways. Will a high altitude work? I imagine ti
would take two days to get to Manhattan.

The main thing that hits me about your idea is, the altitude you are talking is right in the jetways. I don't think you would get clearance for a flight plan like that. I think you would be better served flying above 60K ft.

20. Re: [GPSL] 500 mile flight?

Yahoo group: GPSL (2002 — 2008)
Date: 2002-05-16 18:49:28 UTC
From: Ralph Wallio, W0RPK
Topic: 17 Message: 20

The discussion of Mean Zonal Winds (MZW) at http://users.crosspaths.net/~wallio/MZW.html helps us start planning toward a long distance mission (but lets plan toward more than 703.02 miles to give us a chance at breaking the SSOK/WB0DRL record - see http://users.crosspaths.net/wallio/RECORDS.html). MZW data includes mean wind speed (m/s) at various altitudes but there is no directional component other than westerly vs. easterly.

Referring to the data table for 40dN latitude and looking at winds between 60k and 80kft, we can see that December-January would be best for a west to east flight. MZW velocity varies 10-18m/s (20-35kts) depending on altitude. Based on these mean values and an average of 27.5kts (31.6mph), it would take 704/31.6 = a little over 22-hours aloft to break the record.

Taking this MZW estimate up to 24-hours and 760 miles, the mission could be launched late in the afternoon from the Denver area and recovered before nightfall the following day. Touchdown would be somewhere on an arc running through western Wisconsin, western and central Illinois and eastern Missouri from Duluth, MN to Little Rock, AR. This is as close as we can predict this far out but there would be significantly more precision during the final days of preparations.

Winds aloft at lower altitudes are highly variable in both speed and direction (hot air balloon distance record breaking attempts often wait months, even years, for the right conditions, 10k-18kft) but they are somewhat dependable within a season at higher altitudes. I say "somewhat dependable" because our collective flight experience shows significant variations in characteristics for flights in the same month (see MZW discussion). EOSS-46 experienced easterlies above 60kft in January which are totally unpredicted by MZW data while EOSS-53 in December matches the MZW prediction almost perfectly.

Launching in the late afternoon would minimize helium loss from the zero-pressure envelope due to solar heating during the early hours of the mission. After sunrise solar heating would provide more lift helping keep the balloon and payload above 60kft and controlled airspace until flight termination. Precision track predictions in the last few days before flight would allow the recovery crew to position themselves appropriately, southeastern Missouri to west central Wisconsin.

Well in a month, I'll be crewing for the RAAM and will travel from Portland, OR to Pensacola, FL basically non-stop. It took Fabio a little over 9 days to ride the race a couple of years ago, hope to be faster this time. ;-)

http://www.ultracycling.com/events/raam.html
http://www.raceacrossamerica.org/

I could monitor it during the race. ;-)

Topic: 22 Message: 22

Ralph, I'm planning to work on the GPSL logo again this weekend. However, when I search my PC in the classroom, I can't find the topo map you emailed. I may have it at home. But if I don't, then it probably won't be until next week before I have access to email to ask for the file. Can you email me the file again? I'll start a search over the internet for a copy, just in case.

I plan for the logo be just like my first suggestion, but witht he topo map of Kansas instead.

Paul

23. 500 mile flight (II)

Yahoo group: GPSL (2002 — 2008)
Date: 2002-05-17 19:27:56 UTC
From: K. Mark Caviezel
Topic: 23 Message: 23

Yes, I am appraised that the 30-40k feet altitude I mention is 'right in the middle of the jetways', but I recently read "Around the World in 20 days" by Bertrand Piccard and Brian Smith, the team that circumnavigated the Earth in 1999 in a big Rozier balloon. Most all of thier flight was 15-35k feet altitude. Yes, air traffic control was an issue (particularly border crossings), but it was an issue that they surmounted within the rules of all the countries they flew over.
The winter winds in general from altitudes 10k feet to 80k feet are good for a flight from here in Denver to locations east of here, but GPSL is in the summer, and my knowledge of summer winds over Denver put a cap of about 50k feet for a balloon wanting to go from here to there.

The basic issues are:
a). balloon vehicle capable of float, multiple altitudes desireable (I can do this)
b). telemetry, control, termination. All this has been done on EOSS flights and "ES-OS" flights.
c). flight prediction/flight management. Similar to what most balloon groups do for all flights anyways, with a twist of long time aloft and significant lateral travel over the ground.
d). "political issues" - FAA, responsible flight with other users of aerial navigation. Piccard and Smith did it, manned, in 1999 with a champagne budget, I'd like to do it, unmanned, in 2002 with a "beer and pizza" budget.

I am seeking help for those interested in helping on c). and d). to see if we (the amatuer ballooning community) can pull this off in a safe and successful manner.

24. Re: [GPSL] 500 mile flight (II)

Yahoo group: GPSL (2002 — 2008)
Date: 2002-05-18 15:08:23 UTC
From: Ralph Wallio, W0RPK
Topic: 23 Message: 24

All of these "around-the-world" attempts were flying in the busy 15-35kft altitude range but they were using altitude encoded radar transponders and in constant communication with air traffic control. ATC could always identify them on radar and vectored more maneuverable aircraft away from them. In my opinion, these manned flights are not reasonable operational models for much less significant unmanned missions.

It is possible to fly a transponder, even with encoding, in an unmanned high altitude payload but they are expensive, ~$2,000, and they use a lot of power. It is my general impression that without a transponder and constant communications with ATC, the FAA would consider an unmanned balloon cruising at 15-35kft to be derelict and a threat to air navigation.

Summer winds aloft above 60kft would not be useful for a west-to-east flight. If we want to fly during the summer above controlled air space (above 60kft) we would have to go east-to-west at a much slower speed of 4-8m/s (7-15kts, 9-18mph). A record breaking 710 mile flight would therefore take 710/13.5 = ~52 hours which is far two long for an amateur zero pressure mission. (This MZW-derived estimate compares nicely with NASA/NSBF missions in August 2000 from south central Iowa to southeastern Nebraska, roughly 200 miles in 16 hours, averaging 12.5mph.)

Timing this mission for GPSL-2003 would be a problem because attendees are already completely scheduled with a busy symposium and multiple flight schedule. There would be very little, if any, time available for attendees to participate in a complicated long-duration long-haul mission.

All of this takes me back to a west-to-east 60-80kft mission during the winter. Ascent and descent would be in controlled airspace but only for an hour each. The roughly 24 hour cruise would be above controlled air space so a transponder and constant ATC contact would not be required. It is easy to imagine a payload of two <6-pound packages, including ballast dumping, so the flight would be exempt.

A winter flight would allow the eastern recovery troops to dedicate a weekend to the mission while driving long distances to be in the right place at the right time for descent and touchdown. Home stations at intermediate distances, spaced ~200 miles apart, could capture telemetry and report their observations. They could also be equipped for an "emergency" cutdown command if system failure allowed descent into controlled air space.

It is reasonable to believe that a recovery team can be put together at this end (Iowa, Illinois, et al.), that intermediate stations can be recruited for any possible flight track, and that winds aloft data and track prediction processes are dependable. I believe this can be done and safely.

25. re 500 mile flight

Yahoo group: GPSL (2002 — 2008)
Date: 2002-05-20 20:18:05 UTC
From: K. Mark Caviezel
Topic: 25 Message: 25

Points well made, Ralph.
I'll just leave the proposal on the table, see if we form a critical mass to move this project forward. My goal is not to break the distance record, but rather to navigate a balloon to within a reasonable radius of a desired target far away. Denver-Manhattan seems do-able technically, but clearly ATC "buy-in" needs to happen.

Topic: 26 Message: 27

Paul is doing the vast majority of the work to put GPSL-2002 together so I will bow deeply to him and accept this motto.

However, we should understand how unusual it is to reach 100,000ft. In the process of collecting data for discussions about Mean Zonal Winds (http://users.crosspaths.net/~wallio/MZW.html) and Ascent Rate Variations (http://users.crosspaths.net/wallio/ASCENT.html) you folks sent me a lot of flight data for missions past. For Mean Zonal Winds I accepted mission data from before and after SA was turned off on 02May00 and we have a total of 54 missions in the study. Only 4 of those missions went above 100,000ft which is 7.4%.

For analysis of Ascent Rate Variations I only used data from missions after SA was turned off. There were a total of 28 missions in the study of which only 2 went above 100,000ft. Again, that is 7.1%. This indicates we are not flying higher as time goes by.

It appears we should not be overselling our collective ability to make it to 100,000ft because it happens less than 1 flight out of 10.

Topic: 26 Message: 28

I think most of us have the *ability* to get to 100,000 ft, but some of us have not tried very hard on most flights.

The baseline for a 100kft effort, when you're lifting more than 2-3 lbs., is a 1200g balloon. To me, anyone flying less than a 1200g balloon with more than a flyweight payload is not expecting 100kft. For NSTAR, I've flown only 4 1200g balloons in 10 flights (none larger). Three of these four were deliberately overfilled to decrease the flight distance, which means that I'm 0 for 1 (01-B) in actual attempts at 100kft.

It would be interesting to see the numbers for 1200g-and-larger balloons flown. I believe everyone at GPSL is planning to use 1200g.

Do I understand this exchange to mean we are not going to keep the info on the groups page?

I have been waiting to see what was being used before I decided. However, it does not look like all of us can view it as a collection.

I think sharing the info would be good, isn't that why this group was created? What if we keep it in the files area or create a Database?

I have not created or used a Database in Yahoo Groups, this may not be a good idea. However, I would be will to give it a try. Input from the rest of you?

Thanks,
Don

I will go back to being silent.

The intent is to make all this public. I haven't had the time to compile what I've gotten into a easy-to-read form. Even a simple HTML page is probably sufficient.

I haven't found the Yahoo database stuff to be all that useful.

Everything I've received has been through the GPSL or KNSP group e-mail so if you review the archive in the last month or so you'll know what I know.

36. 100k feet?

Yahoo group: GPSL (2002 — 2008)
Date: 2002-05-24 06:42:20 UTC
From: K. Mark Caviezel
Topic: 36 Message: 36

7.4% of flights going to over 100k feet is a heck of a
lot more frequent than most anything else that flies.
Paul points out that many missions don't realistically
expect to break 100k, but if the flight operators
'simply' put some extra money into a larger balloon,
then it would happen with more frequency.
I like Paul's slogan for the GPSL.

If I could get a tank that would be great also. I will be driving my truck to the gpsl and might be able to help haul the tanks. I may not be able to get off work on Friday early so I might not get there till about 6:00 or 7:00pm. Keep in touch and thanks de kd0fw

Hi Keith,

The symposium is scheduled for Friday, July 5th starting at 9am
and lasting most of the day. The launch will be Saturday the 6th
with a rain date of Sunday the 7th.

I believe both Manhattan and Topeka have limited air service, but
it's probably expensive. It's probably more cost-effective to
travel to Kansas City (MCI) and drive a rental car the 120 miles
(2 hrs) from the airport to Manhattan.

Your return date depends on how sure you want to be of seeing the
launches. If you go back Sunday afternoon, you could chase with
us on Saturday if we get off the ground, or if it ends up being
on Sunday you'd at least see the launch.

Thanks for the info..

The web site told me what I needed.. It is at K-State.. My father went there.. My grandparents live in Clay Center.. I am going to fly to KC, get a car, and go visit my grandparents for the 4th, then go to Manhattan for the conf and launch.. Since it is close enough, I will stay with my grandparents and save on the hotel bill. I know the area much better than you would expect for someone from New Jersey....

Also, what is JNSC and where exactly is the launch from???

Keith

The launch will be at the Johnson Near Space Center, which is
about 10 miles south of Manhattan. The main feature of the JNSC
is a large storage building where we can fill 4-6 balloons inside
out of the wind.

Take a look at the pictures linked from this site - there are
several taken at the launch site.

48. Frequency coordination

Yahoo group: GPSL (2002 — 2008)
Date: 2002-06-01 16:45:45 UTC
From: Mark Conner
Topic: 48 Message: 48

Hi everybody,

It's been a busy few weeks, and it's not getting any better for me. In addition to the GPSL, I have a design review for a software project next week, we are doing some minor renovation, painting, and installing new floor and carpet in the house in June, and two weeks after the GPSL I'll be getting married.

I think we are gravitating towards the use of 144.34 MHz for primary APRS use for all payloads that will support it. I have been told that it's also used for FM simplex for ATV DX coordination, but most balloon groups use it for non-.39 work. ANSR uses 70cm for downlinks, so they'll be the exception. Backup beacons can use 144.39 MHz if desired, keeping in mind that you should keep the rate down (1x/minute or less) so we don't hog the channel.

We have used 147.585 MHz for SSTV in the past in case anyone plans to fly that mode. A simplex repeater can use 446.300 MHz which appears to be pretty clear in this area.

I believe we have frequency information for ANSR, TVNSP, KD0FW, and NSTAR, though not yet compiled in one place. I would like to get info from EOSS, WB8ELK, HABITAT/SkyLab, and Traveler. I don't think we have reps from Traveler and EOSS on the GPSL list, so I'll see about getting them to come up on the net here. If you've posted your info elsewhere, please copy it here to the GPSL list so we have it archived. See http://groups.yahoo.com/group/GPSL/files/ANSRFreqPlan.txt for an example. You can either post it or upload it to the files area.

49. EOSS "Standard" Frequencies

Yahoo group: GPSL (2002 — 2008)
Date: 2002-06-01 20:50:20 UTC
From: lcerney
Topic: 49 Message: 49

Hello all,

EOSS "standard" frequencies are:

Telemetry 144.34 MHz
Tracking Beacon 147.555 MHz
xBand Down 147.555 MHZ
Up 445.975 MHz
ATV 426.25 MHz
Simplex in field 146.58 MHz

I also suggest a back channel frequency for each group to keep
tactical chatter off the repeater. EOSS could use our xBand Up link
frequency of 445.975 simplex.

This is a preliminary listing. Many Freqs can be changed if needed.
I'm sure Mike, W5VSI, will have more to add when he gets on the list.

Topic: 51 Message: 51

I am sorry, but an emergency reschedule at work has caused me to cancel my particpation at GPSL 2002. As this project is of National need, I will not be able to attend your fine symposium. I will however, endeaver to get our ANSR video up to the EOSS team and I hope it will tell our story here in dry, dry, dry, hot, hot, Arizona. I will also write a tribute to Bill Brown from my early memories of his projects and the inspriration he provided to us in Colorado and that we still feel in Arizona. Sorry for the cancellation.

Shucks, Jack, sorry to hear the news.

I had been thinking about lofting a low altitude
floater from Denver to Manhattan, but the critical
mass for that project just hasn't formed, and indeed I
will be out of the country July 5th and onwards.

If any of the GPSL participant groups want to try
their hand at a modest sized zero pressure
polyethelene floater, just let me know. I'd be happy
to provide a bag for the GPSL event. Check photos
from EOSS 55 mission archieves to see one of my home
built bags in action.

I am still thinking about the payload I'll be launching...scavenging parts from a dozen past payloads sitting in my garage at the moment. Currently I plan to fly an altitude record attempt with APRS GPS on 147.45 MHz (alternates are 144.34, 144.36 or 144.39) and camera video on 434 MHz ATV....I'll also have a 20 milliwatt 28.322 MHz CW transmitter as well for tracking.

From: Ralph Wallio, W0RPK
Topic: 55 Message: 55

Michael,

My response is delayed because I have been on the road for several days. Thank you for this good news. There are very few of us involved in amateur high altitude ballooning with roughly 10 active programs nationwide at any given time. Regardless, GPS receiver performance above 60kft is absolutely necessary.

We do not have access to a GPS simulator so the only method we have to test for high altitude performance is to fly a mission and find out. Typically we fly a primary receiver we already understand while we test a secondary receiver. Primary and secondary receiver NMEA output rides an Amateur Radio telemetry downlink to ground stations either directly or via payload processing.

I maintain a web page where we attempt to steer designers toward GPS receivers we know will work at high altitudes (see http://users.crosspaths.net/~wallio/gps60kft.html). I would like to add your information to this list but we first need to fly a test mission. Unfortunately all SIRF and partner, e.g., AXIOM, specification sheets I have seen specify maximum altitude as 60,000ft (this includes all SIRF specification sheets in your web pages).

Manifests for several flights in early July are already locked but we will prepare for a test flight and advise you of results.

Ralph,

I flew an Axiom Sandpiper model receiver using the SiRF chipset on a mission in the Gulf of Mexico on our last Rockoon mission...it flew on the launch platform gondola. Their engineer claimed it would work over 60k feet just like the Motorola VP Oncore would...i.e. as long as you didn't exceed the speed limit (somewhere over 600 knots or so), the altitude limit of 60k would not be a problem. Some receivers will lock up at 60k feet regardless of the speed travelled, it depends on the manufacturer. I know that the VP Oncore works great, the Garmin 35 and (if specially modified, the Trimble See Vee 6).

My experience was that although we were only travelling about 20 knots groundspeed, the Axiom Sandpiper receiver completely locked up at 60k feet and never came back up again during the rest of the flight. I haven't tried any more flights with the Axiom units, although I may try an experiment using the very tiny Swift model Axiom receiver that I have as a backup GPS to see if it works above 60k.

From: Ralph Wallio, W0RPK
Topic: 55 Message: 57

Bill,

Use of SiRFStar chipsets above 60kft is being discussed because AXIOM Sandpiper receivers are appearing on the inexpensive surplus market. I have evaluated a pair of these receivers for terrestrial applications, e.g., APRS, and find documentation and PC software to be readily available.

Michael Castle has further contributed his knowledge that SiRF code will allow receivers based on SiRFStar-II chipsets to work above 60kft when velocity is <1000kts. However, the AXIOM Sandpiper receiver uses the SiRFStar-I chipset which Michael had not yet completely investigated. Your empirical evidence appears to definitively tell us that code in the SiRFStar-I chipset limits performance to altitudes below 60kt regardless of vehicle velocity and acceleration.

All models of AXIOM Swift receivers use SiRFStar-II chipsets so Michael's contribution is valuable.

Please compile and forward detailed information required for an AXIOM Sandpiper entry to http://users.crosspaths.net/~wallio/gps60kft.html and I will add it to the RED list.

For comparison, this what I see when my Sandpiper receivers come up:

SiRF Baseline Version: 1.3.1DKIT144 Axiom Variant: k201AX
$
Build date: Nov 12 1999
$Build time: 14:42:07

We're also interested in building a cheap, 2m backup signal. I've attached the data sheets on a Motorola MC2833 (which aren't being manufactured anymore, but you can still get them). Radio Shack has a crystal that will put it in the 2m band (I forget where off the top of my head) that they sell for about $1.

That's as far as I've gotten on the project - maybe this summer.

Probably is OK to be added. Can you reach the page w/o signing into
Yahoo? If so, it may be better to link to it on Yahoo so that when I
update it I can just do it there.

- Mark

65. APRS equipped record breaking amateur rocket

Yahoo group: GPSL (2002 — 2008)
Date: 2002-06-13 22:22:52 UTC
From: Ralph Wallio, W0RPK
Topic: 65 Message: 65

NEWINGTON, CT, Jun 13, 2002--If all goes as planned, a group of Amateur Radio operators and amateur rocket enthusiasts will make aerospace history this month by putting the first amateur rocket into space. If the attempt succeeds, the suborbital vehicle will carry its Amateur Radio payloads to an altitude of more than 60 nautical miles.

PAYLOAD DETAILS

Publicity requests are going out this weekend. Please review payload details near the top of http://users.crosspaths.net/~wallio/GPSL2002.html and forward additions/corrections/deletions to me ASAP.

PRESENTATIONS

Total time for presentations, 9am-noon and 1-5pm, will be 7-hours. We will have 8 presentations and need a few minutes of break time in between. Plan on having 45-minutes per presentation including discussion and questions. The first slot will be opening remarks and short ~5-minute program discussions, e.g., ANSR, EOSS, et al.

A/V SUPPORT

Paul collected A/V support requirements but did not confirm availability of equipment before leaving for an extended trip to the southwest. As I prepare my discussion it occurs to me that support for Power Point, a PC and projector, has not been confirmed. Just in case, I will be ready with a Power Point file and overhead transparencies. Perhaps someone as access to a laptop and projector that can be brought to GPSL so we can depend on having Power Point capabilities.(?)

Ralph & all,

I really wanted to come to GPSL, visit and write an article for Amateur Television Quarterly, but it just is not going to happen. A couple of questions:

Is there someone that would be willing to cover the event with a write-up and photos?

Will any of the forums be videotaped, and if so can copies be purchased?

All the best to those that are going. I know you will all have fun.

69. GPSL reporter and video guru wanted

Yahoo group: GPSL (2002 — 2008)
Date: 2002-06-14 18:13:00 UTC
From: Ralph Wallio, W0RPK
Topic: 69 Message: 69

This is the second request we have had for a GPSL video tape. Seminar discussions would need to be taped morning and afternoon, a total of roughly 6-hours. Additional footage from the mass launch could be added to almost fill an SLP T-160. Required equipment would include a camcorder or video camera, a large tripod, a VCR (so the seminar master could be SLP), and either a wireless or wired microphone up forward near the speaker. Two or more volunteers could share the pan-tilt-zoom chore. I suspect there will be paid requests for more than just two copies. If anybody knows anybody who knows anybody that would like to take responsibility for this service please ask for their support.

Anyone who would like to report on GPSL for Gene Harlan, WB9MMM, and his ATV Quarterly please contact him directly.

70. What are the chase frequencies for GPSL?

A few questions for some of the groups planning to fly next month.

I define "time-slotting" as the ability to keep your transmissions between X and Y seconds after the minute, using the time reported in the NMEA output from your GPS.

EOSS: Can your 144.34 payload time-slot its beacons? What callsigns will you be using?

TVNSP: I believe you're using the KPC-3+ second serial port to control transmissions for your 144.34 payload - is this correct? If so, you can therefore time-slot. Are you planning to fly a backup beacon - if so on what frequency? What callsigns will be used?

WB8ELK: Can you time-slot your 144.34 beacons? If not, does it beacon every X seconds, or is it semi-random? What call do you plan to use?

KD0FW: Is it OK to change your simplex repeater to 147.585, or do you have another frequency you'd prefer?

Traveler: You sent me e-mail earlier that your programming will not time-slot. Is it every X seconds, or semi-random? I think as long as it's not too close to 60 seconds for a repeat interval we shouldn't have a problem.

ANSR: since you're transmitting on 70cm you can set up your telemetry as you wish.

I would like to use a 70cm frequency for chase comms - if we use 2m we'll desense our data reception (though ANSR has the opposite problem). We'll probably select a convenient "rally point" near the predicted landings for everyone to head towards after they recover their payloads so everyone knows where to go if they lose comm with the rest. Depending on where we end up going, cell phone coverage ranges fair to none. I have no problems using the NSTAR simplex repeater (if it flies) as a chase frequency - this will let distant stations listen in on the fun.

Once I get answers back on the above, I'll work out a strawman proposal for the division of clock times and intervals to be used.

Here's the list of people I have wanting helium. If you're name doesn't appear and you want helium, please let me know ASAP. I'll check email on Friday and update my list. If you get this message after Friday, please leave a message on my cell phone (208) 631-7162.

Me
Mark Conner
Bill Brown
Zack Clobes
Mike Bogard

Helium is $45 a tank, payable during the symposium. I plan to drop the tanks off at the Johnson Near Space Center on the 2nd of July. I'll pick up an extra tank. I'm assuming everyone wants just one tank. The tanks hold something like 240 cu ft of helium, so I've had to use part of a second tank to launch a 12 pound capsule. With the extra tank, we'll have 6 tanks, the minimum needed fo the $45 price. I'd like to see if I can talk someone into getting a second tank as a backup. I'll have all tanks gauged before leaving Linweld, just to make darn sure we don't get an empty tank.

I still need to line up help moving helium tanks, Linweld will not deliver tanks at this price.

Answers below from TVNSP, Traveler, and KD0FW. Still awaiting inputs from EOSS and WB8ELK.

I define "time-slotting" as the ability to keep your transmissions between X and Y seconds after the minute, using the time reported in the NMEA output from your GPS.

EOSS: Can your 144.34 payload time-slot its beacons? What callsigns will you be using?

TVNSP: I believe you're using the KPC-3+ second serial port to control transmissions for your 144.34 payload - is this correct? If so, you can therefore time-slot. Are you planning to fly a backup beacon - if so on what frequency? What callsigns will be used?

TVNSP will transmit between :00 and :11 using KD4STH-11. No backup beacon.

WB8ELK: Can you time-slot your 144.34 beacons? If not, does it beacon every X seconds, or is it semi-random? What call do you plan to use?

KD0FW: Is it OK to change your simplex repeater to 147.585, or do you have another frequency you'd prefer?

KD0FW's simplex repeater will be on 147.585 MHz.

Traveler: You sent me e-mail earlier that your programming will not time-slot. Is it every X seconds, or semi-random? I think as long as it's not too close to 60 seconds for a repeat interval we shouldn't have a problem.

Traveler will beacon at an interval of a few seconds more or less than 60 so we don't hit one payload's slotted beacons all the time.

86. Time Slot APRS

Yahoo group: GPSL (2002 — 2008)
Date: 2002-06-19 21:28:33 UTC
From: Michael Gray
Topic: 86 Message: 86

If a TDMA (Time Slot) method of sharing the 144.34 MHz frequency is used for APRS, someone should specify if the time is GPS or UTC. There is currently a 13 second difference between the GPS and UTC time of day. Most GPS engines correct for the difference and report UTC, but not all of them do or they can be configured to report either one.

90. First prediction

Yahoo group: GPSL (2002 — 2008)
Date: 2002-06-20 15:58:41 UTC
From: Mark Conner
Topic: 90 Message: 90

Granted, 2 1/2 week forecasts aren't worth much, but I ran one anyway.

For consistency's sake, I'm going to run predictions using 1000 fpm ascent, 1000 fpm sea-level descent, burst at 95,000 ft. Bursts at lower altitudes will move the predictions a few miles east. Faster ascent and descent will (in general) shorten the distance along the same direction as the original prediction.

With these conditions in mind, the forecast I ran shows a landing 9.5 miles from launch on a bearing of 054 degrees. The forecast indicates we should have warm humid conditions (low 90s in the afternoon) with afternoon and evening thunderstorms.

I have the following dinner reservations

Traveller: 7
NSTAR: 6
Bill Brown: 2
Me: 1

Based on these numbers, I'll make reservations for 30. Does this sound good?

For helium, I have the following reservations

Bill Brown: 1
NSTAR: 1
Traveller: 1
Mike Bogard: 1
TVNSP: 2
EOSS: 2

Based on these numbers, I'll get 8 tanks of helium. There may be two half empty tanks in this number, so there should be some cushioning.

Paul

98. Long-range forecasts

Yahoo group: GPSL (2002 — 2008)
Date: 2002-06-25 20:45:16 UTC
From: Mark Conner
Topic: 98 Message: 98

The long-range forecasts for the 6th fall into one of two categories so far:

1) The high-pressure ridge at 500mb and above is right on top of Kansas or a little to the east. This makes for southerly winds at the surface with plenty of Gulf moisture and heat. The upper winds are very light, making the landing somewhere within a 10-15 mile circle of the launch site.

This isn't so good as there is a large reservoir to the north of the launch site, one to the west, and Fort Riley in between. If we land NE-SE-S of the launch site, we're OK.

2) The ridge shifts westward a bit. This puts the surface high right over Kansas, making the winds light or northeasterly at the surface. Aloft, the winds are from the west or northwest at 20-30 knots.

This scenario gives us more pleasant weather (high 80s with drier air instead of 90s and humid) and a landing about 30 miles to the east or southeast. This in general puts us in a more favorable area for a landing.

So far, none of the predictions have indicated a chase >40 miles, so we may be able to stick around after launch for up to an hour and entertain questions, etc.

From: Mark Conner
Topic: 99 Message: 99

I've given the five groups who can time slot on 144.34 their slots. See http://members.cox.net/n9xtn/gpsl_2002_freq_coordination.htm for details. The data will probably be on Ralph's page soon.

I went with 12-second windows once per minute because I figured trying to hit a six-second window may be difficult if you want to send more than one packet. Comments welcome - it's not too late.

EOSS has indicated they are still considering whether to fly ATV or the cross-band repeater - probably will not be both. If anyone else has updates on their payloads (especially RF-emitting ones), let me know.

101. Alternate launch site may be needed

Yahoo group: GPSL (2002 — 2008)
Date: 2002-06-27 19:17:08 UTC
From: Mark Conner
Topic: 101 Message: 101

Today's predictions for both Saturday and Sunday (6th and 7th) show extremely light winds below 70,000 ft. Both predictions show a landing about 7 miles from the launch site on a bearing of about 020. This is in the general area of the KSU campus in Manhattan.

There's not much we can do to help ourselves to get away from town given this wind profile. Going for a slower ascent rate would move the prediction north of town towards a reservoir. Going for a lower burst or cutdown would move the prediction east along the Kansas River, which in general is wooded.

If this wind profile holds up (and it's a 9 day prediction after all, so it may well not), we need to investigate another launch site. The town of Alta Vista, about 15 miles south of I-70 on KS 177, would be ideal in this situation. However, I don't know if there is a park, ball diamond, or some other public open ground we could use. Alma (15 miles south of Exit 328) appears to have a high school with a football field and other open space and would also be a decent site (except for its proximity to I-70).
http://terraserver.homeadvisor.msn.com/image.asp?

That would be about 40 miles from Manhattan - not unreasonable, and sure beats not launching. I see on Mapquest there is an airport a few miles east of Herington - assume that's it. If they have a hangar we can use that morning that would be great.

The only downside is that we have Junction City and Fort Riley to our north about 25 miles. If we have a 350-020 track >25 miles, we'd have to do something else.

Don, do you have contacts at the Herington airport or can you get some? Sure would be nice if we could have that prearranged as an alternate site if we need it.

- Mark

105. ATV coordination

Yahoo group: GPSL (2002 — 2008)
Date: 2002-06-28 01:56:53 UTC
From: Mark Conner
Topic: 105 Message: 105

I received the following from Mike W5VSI of EOSS:

Re ATV on 434 and 439 MHz: remember that if these are NTSC AM sigs,
they have sidebands running out to +/- 6 MHz around the carrier freq.
Thus the 434 USB will go out to 440 Mhz, and the 439 LSB will go down to 433 MHz. Although the video bandwidth may be pretty puny at the extreme edges of the sidebands, the audio and chroma subcarriers of 4.5 and 3.58 MHz will also appear in both sidebands.
Since each ATV signal occupies 12 MHz, the minimum carrier separation
to avoid adjacent channel QRM is 12 MHz. So two ATV sigs will occupy
24 MHz inside a 30 MHz-wide ham band, and that's why I don't plan on bringing out ATV.

For WB8ELK and KD0FW - can you separate your carrier frequencies some more, or should we just fly it as is and see what we get? I don't have any experience with ATV to have a feel for how badly this will affect us.

I would think that a few miles of separation and that I will be horizontal polarized would have some effect on the out come. I think that it would be great to see three video signals all on at the same time in the band. If we don't try it we will never know for sure.

There will be some interference with strong signals from the two balloons at 434 and 439.25 MHz, but probably not too bad when they get weaker, particularly if the two balloons seperate a bit during the flight (different ascent rates will help out here).....it will be interesting and folks will have lots of multi-channel ATV to watch on Saturday.

109. Forecast update

Yahoo group: GPSL (2002 — 2008)
Date: 2002-06-28 16:05:04 UTC
From: Mark Conner
Topic: 109 Message: 109

Regardless of the winds, it should be hot and humid next weekend (highs in the 90s, dew points in the high 60s). The default ascent/descent profile I use (1000 fpm up/95kft burst/1000 fpm sea-level descent) has moved the landing to 337 at 16 miles. From the Manhattan site, that puts it down in the north part of the Fort Riley cantonment.

If we use the Herington airport, the landing is in a rural area about 10-12 miles SW of Junction City. The airport's coordinates are 38.7018 N and 96.8150 W (in decimal degrees). Most any permutation of fast/slow/high-burst/low-burst gives favorable landing areas.

I've attached the forecast wind profile for those who'd like to run predictions themselves.

- Mark

Hi Mark,

It's been my experience that during July and August when there are light winds in the jet stream region, the stratospheric winds will prevail and depending on how high the balloons go, quite often you'll end up WEST of the launch site.....unless there is a front coming through, this very well might be the case for the launch.

73s de Bill WB8ELK

111. One week to go

Yahoo group: GPSL (2002 — 2008)
Date: 2002-06-29 20:03:21 UTC
From: Mark Conner
Topic: 111 Message: 111

It appears it could be somewhat breezy next Saturday morning. A surface low is forecast to form over the Front Range, and the gradient between than and high pressure to the southeast will make for winds from the south-southwest gusting to about 20 mph in the morning.

The forecast track indicates a landing due north of the launch site at about 25 miles distance. From the Herington airport, this puts the landing just north of Junction City into the south edge of Fort Riley. From the Manhattan site, we end up within a half-mile of Tuttle Creek Lake. I've put graphics of this up at http://members.cox.net/n9xtn/gpsl-2002-forecast.gif .

Still hoping for a change in the forecast, as a northerly track of this distance is kind of a problem.

There is a small airport about 15 miles east of Manhattan at Wamego, a turf field near Council Grove (about 35 miles south of Manhattan), and another turf field at Onaga (30 miles NE of Manhattan). All are public and have little usage according to airnav.com, but have practically no facilities. Any of these sites would give favorable landing areas with some room for error.

112. Repeater reminder/forecast update

Yahoo group: GPSL (2002 — 2008)
Date: 2002-06-30 15:47:10 UTC
From: Mark Conner
Topic: 112 Message: 112

The Manhattan Area Amateur Radio Society (MAARS) has welcomed us to use their 147.255+ repeater while we're there. It should be quite suitable for talk-in and so forth during our stay.

Today's wind profile forecast has not changed much above 20,000 ft, but is lighter out of the south below that. I think that may be the biggest variable for us in the forecast (at least as long as the next upper-level low stays far enough west). The prediction today is 354 degrees at 13 miles, which from Herington is 8 miles south of Junction City and in a good area. From the Manhattan site, the landing would be in a small area between Ft Riley and Tuttle Creek Lake.

Okay, I'm here and have some email access. If we have to move the launch site, I'm going to have problems with the helium. Adding Don's request, I have nine tanks of helium to deal with. My little Prizm would have a hard time moving a single tank.

I'll need some help here. Actually, a lot of help.

I'm heading to Topeka to line up some media coverage. I'll spend the next two days at the campus checking out equipment and making copies. I'll also make reservations for meals.

If we can avoid moving the launch site, that would be helpful from my end. If we have to move, we need to make plans for moving 9 tanks of helium to the site and helping me get them back to Linweld afterwards.

Paul

114. Monday update

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-01 15:09:08 UTC
From: Mark Conner
Topic: 114 Message: 114

The landing forecast is becoming somewhat more favorable for a Herington launch. Using last night's MRF winds and replacing the forecast above 60,000 ft with real winds from Topeka, I get a landing of 323 degrees at 15 miles. This is about 8 miles south of exit 286 on I-80 and 15 miles SW of Junction City.

Again, this is with a burst of 95,000 ft. Using 75,000 ft for a burst altitude moves the landing to due north at 12 miles.

Don KA0JLF is working on a contact at the Herington airport. Hope to hear soon on whether we can use it.

Topic: 113 Message: 115

Paul, do you still want me to come out and help pick up and move the helium? I can bring my own helium, Mike KD0FW has offered to haul it out there for me, so don't worry about that tank.

As I recall we last left it, I was coming out on the 3rd to help pick up helium and take it to JNSC. I might be able to bring another body with me. I don't really have a good vehicle to move it with, but can get it done. My little car should be able to carry two tanks at a time.

Is there a Uhaul there (I think I remember one) where we could rent a pickup for $19 (that's what I seen on the sides of them here)? That might make it easier. That would make the helium about $2.50 more per tank. I don't know anyone out there with a pickup, myself.

Anyway, I'm waiting to help, just let me know what you need me to do.

AT this point I have 5 people committed for the launch, so we should be ok. There are 3 confirmed for the symposium - Cris took a day of vacation I didn't know about - possibly the 4th person will also make the symposium. I'll let you know.

Later,
Don

I left a voice mail, will keep trying.

Thanks for the 75,000 prediction. I will be flying a 600/300 gram so that is about as high as I expect to get, maybe a little higher if all goes well.

117. Helium and Don's Help

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-01 16:58:34 UTC
From: pverhage1960
Topic: 117 Message: 117

Don, I'll check my cell phone when I get home. Please leave a phone number and I'll call you tonight. Let's plan on Wednesday to get the helium.

I'll need a specific location that we'll launch from. I can't store the helium at my folks place. Where ever we launch from, we need to be able to store helium there, or someone needs to be able to carry all 9 tanks until then. One possibility is to hand tanks of helium to each team at the symposium, or possibly have us all pick up our tanks that day from Linweld (time constraints here).

You'd think these tanks would be lighter with all that helium in them....

This still leaves the issue of how I'm going to get the tanks back to Linweld on Monday. Linweld is open until noon on Saturday, perhaps we can have someone haul tanks after the launch.

Paul

118. Approval to use Herington airport for launch

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-02 01:35:14 UTC
From: Mark Conner
Topic: 118 Message: 118

Received the following from Don KA0JLF (HABITAT/SkyLab):

I just talked to Harold about the Herrington Airport. We can use
it if we want.
Unfortunately the hanger available is not all that big. The
ceiling is about 12' and
the door is 10' high. Does this seem workable? He also said we
could use the areas
around the runway.

It holds 3 planes, two spaces are empty and will be available to
us as long as no
planes come in that need the space. This would be if there were a
storm or
something. Possibly the 3rd plane will be out too, unknown at
this time.

I told him, Paul and I might run down to check it out after we
get the helium taken
care of Wednesday.

Don is planning to take digital pics on Wednesday so we can see
what it's like at the symposium.

Here are some links showing the airport's location:

119. Time slot rundown

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-02 02:45:44 UTC
From: Mark Conner
Topic: 119 Message: 119

Here's what I have for everyone's slot information. Let me know if something's not correct.

KD0FW: Using DF for recovery

Traveler: Not time-slotted, interval is quasi-random. Zack, what's the approximate interval?

HABITAT: Will be using a MIM on 144.34, fixed time interval set to 65 seconds. Interval to be tested.

ANSR: Repeater can periodically QSY to 144.34 if repeater not in use. Mike, you can have the time slot from :24 to :35 (previously for HABITAT) for this if you wish - let me know what you decide.

TVNSP: GPGGA, GPRMC, GPGSV, and BS2 output from :00 to :11

WB8ELK: APRS data from :12 to :23

NSTAR: APRS posits containing lat/lon/course/speed/alt/vertical velocity and a telemetry frame from :36 to :47

EOSS: GPRMC; GPGGA, GPGSA from :48 to :59

I think we'd prefer there not be any ground APRS transmissions on 144.34 until all the balloons are on the ground - we'll have a busy frequency as it is! Looks like ~13 packets every minute. Updated table at http://members.cox.net/n9xtn/gpsl_2002_freq_coordination.htm .

See you all in Manhattan on Friday.

Does anyone have a firm list of AV equipment for the presentations? Will we have an LCD projector? VCR? laptop connection for a projector?

Also, thanks to all those helping to get everything organized. Looks like it will be a good conference. Hope we get a good turn out.

121. Re: [GPSL] AV Equipment for GPSL

Date: 2002-07-02 12:00:08 UTC
From: Ralph Wallio, W0RPK
Topic: 120 Message: 121

Paul is in Manhattan but might not be reading GPSL traffic. He recently confirmed that we will have a PC and projector and it is reasonable to assume the required VGA connection could be moved over to another laptop PC. Paul had previously arranged for a VCR and it is reasonable to assume it could feed video to the projector.

123. GPSL forecast update, 2 Jul

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-02 13:48:37 UTC
From: Mark Conner
Topic: 123 Message: 123

Today's MRF run shows lighter winds yet. A 95,000 ft burst shows a landing at 306 degrees at 11 miles. For 75,000', it's due north at 7 miles. Both locations are generally favorable if Herington is used for launch, unfavorable if the Johnson Near Space Center is.

73 de Mark N9XTN

124. AV at GPSL

From: pverhage1960
Topic: 125 Message: 125

Don, I didn't have a phone message from you on my cell phone. Please call (208) 631-7162 and let me know how to contact you. Can we drop off helium at Herington on Wednesday?

I'll check email again later today and early tomorrow.

Paul

126. Herington 2m repeater

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-02 18:04:17 UTC
From: Mark Conner
Topic: 126 Message: 126

According to the various listings, Herington has a repeater at 385' AGL on 147.135+. Some listings indicate a PL tone of 88.5 Hz. If we get out of simplex range of each other and aren't into the Manhattan 147.255+ repeater well, we can QSY there to coordinate before launch and after landing.

Would each team prefer their own simplex frequency and use the 2m repeater only for inter-team comm, or would you prefer a common channel for all teams? I personally would like to stay on 70cm for voice while the balloons are in the air so that I don't desense 2m data reception. However, ANSR uses 70cm for data and may want 2m for voice.

We can do this by e-mail now, or maybe have a session before we break for the day to come up with a chase team comm plan.

- Mark

127. Re: Herington 2m repeater

I'd prefer a single 70 cm frequency for all chase crews, 446.520.

From: pverhage1960
Topic: 129 Message: 129

Sirloin Stockade has us down for dinner. The Gold Fork doesn't accept reservations, but they made a note to themselves to expect up to 30 people for lunch. They'll try to put us all in the same corner.

The visitor booth at the front of the campus opens at 8:00 AM. A one day visitor's parking pass is free. Be sure to ask for one when you get to the campus.

I'll be testing my laptop on the library's AV cart in about 30 minutes.

Paul

130. AV Equipment

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-02 20:48:34 UTC
From: pverhage1960
Topic: 72 Message: 130

Okay, folks, I just checked everything out. The AV cart has a VCR and PC. There is a 3.5" floppy disk drive and a DVD drive in the PC. I was able to connect my laptop to the cart and project the presentation stored on my laptop. I also ran my presentation from the PC off of my floppy. Powerpoint 2000 is installed on the PC. The PC also has an internet connection, but you must use Internet Explorer, not Netscape. I also switched in the VCR without a problem.

The overhead projector wasn't in the room, so my Mother reserved it for Friday.

Michael, I would suggest you bring your stuff. I have at least 5 members coming with my group. I think we will be ok. Our members can assist you. "Never give up! - Never surrender!" (I love that movie).

I just talked to Paul on the cell phones. Michael, Paul said the same thing I did - there will be plenty of people to help, please bring your balloon and launch with us. Michael, please don't put off launching because you are the only one from your group. I know we can round up help for you. If you want a navigator or driver to help you chase I'm sure we can handle that too.

Paul also said we will launch from Herington. He and I will take the helium tanks there tomorrow and lock them in the hanger.

Mark, Paul tried to contact you but I forget what he wanted me to tell you. ;-) Senior life is great! (I think it was the above)

Paul will check email tomorrow after we pickup (possibly) deliver the helium.

More to follow! ;-)

From: Mark Conner
Topic: 146 Message: 146

Spoke with Don and Paul this evening. Herington airport will definitely be the launch site for Saturday.

Paul also wanted me to make sure everyone knows that you *will* need a free one-day permit to park in the lot marked on Ralph's web page. For those of you who haven't been on a college campus in a while, be assured that they will very likely check for permits. You can get one at the info kiosk after 8am on Friday.

For EOSS and ANSR: Please bring all your stuff! We should have enough hands to get all 8 airborne, and should have enough chasers to get everyone recovered. We should have plenty of fill devices for the balloons, and we can launch in two groups if necessary.

Since we're not launching at the JNSC, Paul is looking at moving the dinner earlier to 6pm. We'll probably have a final session at the library to finalize our frequencies and payload manifests.

The PC at the library has PowerPoint on it, and the DVD-ROM in it should read CDs. The VCR also switches through the LCD projector as well as the PC. Nice comfy chairs, and tables at the back of the room for exhibiting payloads if you want.

147. ANSR Launch

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-03 03:12:48 UTC
From: kd7lmo
Topic: 147 Message: 147

ANSR has decided not to launch our payloads at the GPSL. After conferring with other ANSR members, we decided it would be best not to launch. The ANSR-8 flight is only a couple weeks away and it wouldn't give us enough time to prepare for that flight if something went wrong at GPSL. We all know how Mr. Murphy likes to visit.

However, we will still make our presentation at the conference as well as display our payload packages. I will also attend the launch to help in any way I can.

I am certain ANSR will be able to fly on a future GPSL.

Hello all;

I've put together a list of the repeaters along I-70 West of Manhattan, KS. I'm getting ready to program in the freqs to flip through on the way out and back. Thought it might be of some interest to others.

Question to our friends in Kansas, the 2000 ARRL repeater directory shows the Manhattan MAARS repeater to be 147.250 + and some of the emails have shown 147.255 +. What is the repeater freq?

Kansas Repeaters
West to East
Goodland 147.030 + WA0GBN Open
Colby 146.820 - W0WOB Open Wide
Colby 444.650 + W0WOB Open
WaKeeney 444.770 + N0FBS Open
Hays 146.790 - N0IGX Open
Hays 147.180 + KB0RZA Open Wide
Hays 443.600 + KD5WY Open Wide 107.2 PL
Russell 147.280 + KB0QGX Open Wide
Russell 444.950 N0KOU Open Wide Input 448.950
Salina 145.430 - N0KSC Open Wide
Salina 146.730 - N0KSC Open Wide
Salina 146.910 - K0KSC Open
Salina 147.030 + W0CY Open Wide
Salina 442.200 + N0KSC Open
Salina 443.900 + W0CY Open
Salina 444.500 + N0SGL Open Wide
Abilene 145.330 - NU0S Open Wide
Junction City 146.880 - N0UZT Open Wide

The MAARS web site and the majority of the Google references show 147.255+ as the repeater frequency.

http://www.geocities.com/Heartland/Hills/1173/repeater.html

Don and Paul can give us a coverage report tomorrow.

Thanks for researching the list. On your way east, can you try out Herington 147.135+ (maybe 88.5 Hz tone)? If you can hit it from I-70 it should be good for the chase.

- Mark

151. Forecast update, 2 Jul #2

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-03 04:58:41 UTC
From: Mark Conner
Topic: 151 Message: 151

The Eta and AVN now cover the launch time. Unfortunately, the Eta indicates a more unidirectional wind profile and a bit stronger one.

For a 95,000 ft burst, the landing is 352 degrees at 19 miles. This is not far where US77 crosses the Kansas River and is only a mile or two south of Junction City. For a 75,000 ft burst, the landing is at 014 degrees at 20 miles, which is comfortably south of I-70.

If this continues, I plan to switch NSTAR to a 600 or a 350g balloon (have one each of 800, 600, and 350) to get a lower burst altitude and move the landing east, and really gassing the balloon up to shorten the trip.

The AVN model, on the other hand, is more consistent with the previous MRF predictions (297 at 9 miles for 95kft and 355 at 5 miles for 75 kft). It should be consistent, however, as it has the same physics.

In my experience, the Eta is better at the lower levels and the AVN is better higher up. What I did was come up with a hybrid wind profile using the Eta below 20,000 ft, the AVN from 20 to 60 kft, and the latest Topeka sounding data above 60 kft. Doing this gave landings to the NNW and NNE at 10-12 miles in both cases.

Still time for things to change. The wind profile I used is below.

Paul, if you check email, I'm on my way. I'll try to monitor this repeater in Manhattan (147.255+) and call you on it. Knowing you and radio I will expect to call you on your cell phone. ;-) I should see you at the designated spot around 9 a.m.

73 de Don in route.

Mark, I'll take my new repeater directory and see how the list checks out. I hope to run mobile APRS.

The original article can be found on SFGate.com here:
http://www.sfgate.com/cgi-bin/article.cgi?file=/c/a/2002/07/03/BA150175.DTL

Wednesday, July 3, 2002 (SF Chronicle)
Up, up and away/A man and his lawn chair take flight
Steve Rubenstein, Chronicle Staff Writer

San Francisco -- Something important was proved Tuesday in San Francisco when a young man strapped himself into a lawn chair tied to a strand of flimsy balloons and floated 50 feet above Potrero Hill.
It was not a stunt, said the man in the chair. It was a scientific experiment.
No one knew exactly what was proved, however. Perhaps it was that latex can burst under pressure, a concept already well known in San Francisco.
The idea, if there was one, was to recreate the 1982 flight of "Lawn Chair Larry" Walters, the Los Angeles truck driver who flew a similar rig 16,000
feet into the sky above Southern California and lived to tell about it. An Australian TV company had commissioned the joyride for an upcoming special
on urban legends.
"Nothing can go wrong," said stuntman Adam Savage, preparing to go aloft, while a large number of things that could not go wrong kept going wrong.
The latex balloons, purchased for $10 apiece from a surplus store, had an unsettling knack of bursting during inflation. At least six of them popped
before Savage had even taken his place in the chair.
Then the balloons turned out to need twice as much helium to fill as Savage originally calculated, and extra gas cylinders had to be scrounged.
Then, with only minutes before lift-off, the batteries on the emergency walkie-talkies went out.
"I need some triple-A batteries!" the balloonist yelled.
"Somebody go check the deli! Maybe they have some!"

Meanwhile, more balloons popped.
"It's not making me nervous," Savage said, nervously, as the latex shards drifted to earth. "I suppose these balloons have outlived their shelf
life. That's why they were only $10 each."
After a quick review of the flight plan with the TV producer ("You go up, then you come down"), Savage climbed into the lawn chair ($29 from Sears),
strapped on his safety harness (borrowed from a Mission District climbing gym) and gazed up at his towering string of balloons, which resembled a
strand of giant Vidalia onions glistening in the morning sun.
Shortly before 9 a.m., helpers began removing sandbags and releasing their hold on three ropes tethering the chair to parked cars. Savage, not quite sure how to control the proceedings, began to rise slowly into the sky and drift gently over Missouri Street, like the Wizard of Oz making his
getaway.
The TV crew said Savage had soared to a height of 100 feet, but less partial observers placed the altitude at about half that. The walkie-talkie failure was never a factor, as air-to-ground communication was conducted largely by shouting.
The greatest humiliation occurred midway into the flight, when Savage downed a beer and, after warning observers below to stand clear, dropped the bottle over the side. The bottle failed to break on impact, clearly indicating to all the
less-than-life-threatening height of Savage's lawn chair.
"Better have another beer!" someone yelled.
Meanwhile, a modest crowd of gawkers gathered on Missouri Street to take in the spectacle, such as it was. Dogs barked, drivers honked and
passers-by giggled.
After 12 minutes aloft, the TV cameraman had recorded sufficient footage, and there was no good reason for the flight to continue. One by one,
Savage fired a BB gun at the balloons and the chair descended, as Sir Isaac predicted it would.
Back on the ground, Savage reached for a celebratory cigar and basked in what accolades there were. He said it had been eerie to ride his lawn
chair on the same day that balloonist Steve Fosset completed his round-the-world solo flight, although that comparison seemed more of a
stretch than anything that happened to the latex.
"I'm just glad it turned out OK," said Ed Wallace, manager of the electrical warehouse next door whose airspace Savage had drifted into. "It
didn't make any sense at all. He said he had the whole thing worked out perfectly, but it didn't look that way. The potential for him getting hurt

was pretty good."

From: Mark Conner
Topic: 155 Message: 155

The two model solutions (Eta and AVN) are coming closer together, and are showing less risk of getting close to Junction City.

AVN - 95kft burst = 323 deg at 10 miles
AVN - 75kft burst = 020 deg at 10 miles
Eta - 95 kft burst = 325 deg at 15 miles
Eta - 75kft burst = 005 deg at 13 miles

All are favorable landing sites.

Weather for Saturday looks decent but hot. Temps at sunrise will be in the low 70s, and probably will reach the low 90s by afternoon. Dew points will be in the 60s, making it humid. While we shouldn't have the x-country hikes our Western brethern do, bringing some drinks is still recommended. Skies should be relatively clear at the start of the day, but cumulus clouds should form after mid-morning.

The Herington repeater is down for maintenance at the moment, however, the owner (WV0S) expects to have it back on the air Thursday or Friday. I'll get an update when it's back on line.

Is there anyone who can bring a video camera to tape the symposium and launch?

Graphics will be posted soon to http://members.cox.net/n9xtn/gpsl-2002-forecast.gif. SA9 file at http://members.cox.net/n9xtn/gpsl-2002-forecast.sa9 .

157. Helium Transportation

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-03 20:40:37 UTC
From: pverhage1960
Topic: 157 Message: 157

Don and I dropped off the 9 helium tanks at the airport. The total cost for the truck and gas was $100. Needless to say, we need people with cars to help us haul the tanks out of there on Monday. If we get two or three cars, with each one carrying two tanks, we can haul them out in two trips for less than $100.

Paul

158. Dinner on Thursday

Yahoo group: GPSL (2002 — 2008)

From: pverhage1960
Topic: 158 Message: 158

I'll be in town on Thursday. Can I get a list of people who expect to be here on Thursday and may want to go to dinner? I'll recommend a Chinese/American buffet on the sourthwest side of town.

Paul

159. Send email please

From: pverhage1960
Topic: 159 Message: 159

I can send messages to the group, but I can't send email outside the group.

Can someone please send email to kc0dw@... and let him know what's happening as far as our changes? My HT wasn't hitting the repeater very well last night, so he couldn't understand everything I was saying. Once you email him, please let the group know.

From: pverhage1960
Topic: 160 Message: 160

I don't know about the slide carosel yet, can someone bring one?

I've faxed WDAF in KC and WIBW in Topeka. I let materials with the Manhattan Mercury and talked to the Herington Times by phone.

If you know some other media to call, please do so. I'll update WIBW as to the Herington launch.

162. Re: [GPSL] Kansas repeaters

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-03 22:07:36 UTC
From: Don Pfister
Topic: 148 Message: 162

A quick repeater report: the only one that I could hit from the Herington Airport was the Junction City 146.880 that was with less than 50W mobile, but I did have my pre-amp on - but I'm not sure I needed it. I was able to hit it without the pre-amp but I didn't have anyone to talk too. It seemed a bit spotty up and down the hills.

I was not able to bring up the 'Herington' repeater at all. I guess it doesn't exist anymore. I tried with and without the tone. EIC do you know if the Herington repeater is no more?

The Manhattan repeater had pretty good coverage from I-70 but dropped out before Herington. I talked to Mike KD0FW for a long time on it, as I drove between Topeka and Manhattan. He was at his home in Independence, MO. I think he has a better than average antenna system. ;-)

That is about it.

Let me know if you have any questions.

Thanks,
Don

Paul, I will plan to be there.

Just a note, the "truck and gas" was gasoline for the truck - not the helium.
;-)

Actually, other than oil spots on the floor it was not too bad. It is open and bottom of the door is over 10' - ceiling (rafters are at least 12' high.

I put the photos on my page too. I actually dropped some of the dups that weren't very good.

Thanks

167. Forecast update, 4 Jul

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-04 16:26:13 UTC
From: Mark Conner
Topic: 167 Message: 167

Happy Independence Day to everyone!

The Eta forecast is now showing north winds above 30,000 ft - the AVN shows light and variable. This makes only minor differences in the overall forecast track.

For 75kft, the landing is 281 degrees at 10 miles. The 95,000 ft landing is about 8 miles farther west.

If you're thinking about a "catch" as it comes down (I sure am), this is the day. The road grid is pretty good, and the low-level winds should be almost due south. The landing should be about 2 miles due north of the payload's position at 10,000 ft on descent.

There's a 24 hour study area at teh campus, so I have access to group email. I have my cell phone and HT in the car, and I'll be monitoring them shortly. Just finished watching MIB-2, not bad. There comment about postal workers was cute. By the way, the last Star Trek:TNG movie is coming out in time for Christmas.

The hanger at Herington looks fine for filling balloons. I'll pick up a plastic tarp to toss on the group. I don't want those oil spots on my balloon sheets. Funny, I never thought I'd see so many oil spots around aircraft.

I have four people arriving tonight, Bob, Don, Mark, and Mike. I'll monitor the repeater for your arrivals.

See you all later,
Paul

I will be leaving Hutch sometime between 12:00pm and 5:30pm. If I get out early, are there any dinner plans that I should be aware of for Friday night?

Also, the final decision for vehicle comm is on 446.52 simplex? I should have 7.2535Mhz on my vehicle also (if my new magnet holds up....).

What time are we gathering/launching from Herington?

Thanks,
Zack

We'll be launching about 9am CDT Saturday (1400 UTC). Crews should plan to arrive at the Herington airport at 7am (this was decided after the earlier msgs were posted). It's about 1 hour from Manhattan.

I'm working on a formal prediction now, but there shouldn't be much change from earlier estimates.

73 de Mark N9XTN

182. Last prediction update

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-06 02:38:16 UTC
From: n9xtn
Topic: 182 Message: 182

The winds have changed a little, but not that much. For 75kft, we'll be due west at 12 miles. For 95kft, due west at 22 miles. This is a bit north of Hwy 4 west of Herington.

My prediction for NSTAR:
N38° 42.48' W97° 13.66'

There is a gas station in Herington about 1/4 mile west of US77 on US56 (south part of town).

183. 6 for 6 on recoveries today

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-07 04:41:50 UTC
From: Mark Conner
Topic: 183 Message: 183

I'm on my second day of 2.5 hours of sleep, so this will be short.

All payloads were recovered. KD0FW's ATV transmitter was tracked down by DFing - took 2-3 hours after landing to locate it. All others were recovered shortly after landing without incident. Several of us saw 3 payloads touchdown (TVNSP, EOSS, NSTAR).

I think everything functioned very well. Don't know of any significant payload problems.

Having 5 APRS payloads on one frequency worked better than expected. Not that many collision problems, certainly not enough to interfere with tracking.

All in all, a very successful symposium and flights. Congrats to all who made it happen.

Hi everyone!

First of all I would like to congratulate all the teams for a very successful launch, flight and recovery.

This was my first attendance at a high altitude balloon event and I had a wonderful and informative experience. My thanks goes out to all who were responsible for the coordination of the event. I thoroughly enjoyed attending the lectures which I thought were very informative and I also enjoyed meeting a great group of people. The launch and recovery efforts were also very informative and enjoyable even though I was not able to get positions on my APRS mobile. The radio and the clouds of dust down the section roads kept me in touch. I do plan on attending GPSL2003 and any other event that I am able to attend. I will also try to get some interest fired up here in Tulsa and hopefully get something in the air before GPSL2003 and maybe have a payload ready to fly for that event.

Thanks again for a great event!

187. NSTAR videotape

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-08 04:14:01 UTC
From: Mark Conner
Topic: 187 Message: 187

Well, the tape ran OK, but it was a little disappointing. Apparently I induced a lot of twisting into the load line when I wrapped it on different things as we went through the preparation. The camera spun at about 1 revolution per second after release, and didn't slow down for about 10 minutes. I'll try doing some frame captures of the initial few minutes to see what I get - the camcorder has a 1/500 or 1/1000 shutter setting and even with the wild rotation we should get some usable frames with photos of the other balloons near the surface. The high-altitude shots were very nice, though. Appeared to be a rather high smoke layer from all the various fires out west - I don't think we were above it even at 50 kft. The batteries ran out a little bit before burst.

Next time I'll see if I can get the payload to hang free for a while and take out any serious line twist before release.

I haven't watched it closely, but I could not pick out anything that looked like a balloon after the initial ascent. One of these days I'll work out the FOV of the camera, and how well a 10-30 ft balloon would show up at a distance of a few miles.

Goodness, what a blast it was to see six payloads jump in the air at once, then to go chasing and see three of them coming down. The two days were a little tiring and my stress level was a bit high at times, but still one of the most enjoyable days of ballooning I've ever had. So many ideas to try for the future, too.

Mark,

Too bad about the video tape at the lower levels, maybe you can get frame capture or two that are good. Can't let that character from Idaho be the only one to get pictures of the balloons in flight!

They make heavy duty swivels for fishing, they don't have the snaps that have pulled apart, but have regular eyelets on them. I wonder if we put one of them just above the payloads if that would take out some of the twisting. Especially that which is sudden or has quite a bit of torque behind it. It would react much like a slip clutch and maybe give before the payload moved.

As far as the rest of you, well, it was a GREAT time! I too enjoyed the symposium on Friday, and really enjoyed the launch. Even though I have helped with a number of launches, the was the first time I had actually seen a payload land. And then to witness 3 of them on the same day, talk about lucky! I am definitely looking forward to next year!

Doug, KAØO

Subject: [GPSL] NSTAR videotape

Well, the tape ran OK, but it was a little disappointing. Apparently I induced a lot of twisting into the load line when I wrapped it on different things as we went through the preparation. The camera spun at about 1 revolution per second after release, and didn't slow down for about 10 minutes. I'll try doing some frame captures of the initial few minutes to see what I get - the camcorder has a 1/500 or 1/1000 shutter setting and even with the wild rotation we should get some usable frames with photos of the other balloons near the surface. The high-altitude shots were very nice, though. Appeared to be a rather high smoke layer from all the various fires out west - I don't think we were above it even at 50 kft. The batteries ran out a little bit before burst.

Next time I'll see if I can get the payload to hang free for a while and take out any serious line twist before release.

I haven't watched it closely, but I could not pick out anything that looked like a balloon after the initial ascent. One of these days I'll work out the FOV of the camera, and how well a 10-30 ft balloon would show up at a distance of a few miles.

Goodness, what a blast it was to see six payloads jump in the air at once, then to go chasing and see three of them coming down. The two days were a little tiring and my stress level was a bit high at times, but still one of the most enjoyable days of ballooning I've ever had. So many ideas to try for the future, too.

What I use is a big swivel - I think it is rated at like 5000 lbs (I have seen some at 1500# and 500#, if memory serves me - which it doesn't very often anymore). It is for high powered rocketry. As I remember it was high priced too about $5. I'll take a picture or find it on the web.

wow, sounds like all attendees had a great experience. Am sorry to have missed the event, but have an opportunity to support the work of the Mars Society in the Canadian polar arctic on Devon Island.

I've been talking with a Marcus Landgraf, a member of Mars Society Germany, concerning a mars balloon mission that they want to design and test soon. I am assisting him with know-how gained with my flights with EOSS and some of my own flights. I showed him the EOSS web site with flight prediction/tracking flight hardware pictures and launch and landing photos. Hopefully they will move forward soon with their super pressure balloon project.

If you have any RF log files, please upload them to the files
area on Yahoo Groups here:
http://groups.yahoo.com/group/GPSL/files/GPSL2002Logs/

I've put a couple in there already. I'll also have the data from
the APRS Internet feed posted in there in a day or two. Maximum
sharing of the RF logs should help everyone get a fairly complete
record (minus collisions).

I'm gathering RF logs from our tracking station(s) will do as you request.

I pulled logs from findu for all capsules the other night. Would you like me to send them or have you gotten them yet?

From: Mark Conner
Topic: 195 Message: 195

TVNSP recently completed a buy of Garmin GPS-35LVS units at a discount. These are the mouse-looking units complete with patch antenna and are the low-voltage (3-6V) input and true RS-232 output version. They work very nicely for balloon payloads and also work nicely for terrestrial APRS applications.

A few of these units remain available at a price of about $110. The usual cost is $140 or more. Contact Stephanie KC7DBA at stephanie@... for more details and exact pricing.

Date: 2002-07-09 07:03:10 UTC
From: wb8elk@aol.com
Topic: 199 Message: 199

I'd be interested in the amount of nozzle lift that each group put into their balloons, the size of balloon and weight of the flight train (parachute and payload), and also size of the parachute. It'll give me some good data to refine some of my calculations for the Ascent rate and Descent rate programs I wrote for Balltrak.

I had a great time at the event and am definitely looking forward to next year...this time I'll drive up and bring a payload!!

I should have my photos on my website by this weekend:

202. GPSL EXCEL Ascent Rate Charts

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-09 15:18:29 UTC
From: Ralph Wallio, W0RPK
Topic: 202 Message: 202
Attachments: 3 described; binary payloads are missing from this source WARC

GPSL APRS data on 144.34MHz captured by Dan Miller, KE4SLC, in Salina, KS has been sorted in an EXCEL workbook first by payload, then by time. Primary data fields are TIME [UTC], LATITUDE [DD.dd..], LONGITUDE [DD.dd..] and ALTITUDE [feet]. ASCENT RATE [feet/minute] has been derived from finite differences of TIME and ALTITUDE.

There are occasional data gaps and anomalies that have yet to be filled and resolved but the attached charts of VERTICAL VELOCITY are nonetheless interesting. Note that the flights of KA0JLF and N9XTN are very similar as are the flights of KD4STH and W5VSI (the latter two are so similar that we will call them the "Twins").

W0WR experienced a substantially different ascent characteristic than all other flights. Note that while the ascent rates of all other flights were slowly decreasing, the ascent rate of W0WR was increasing.

I will be filling gaps and resolving anomalies as data becomes available. The entire EXCEL file is available as an email attachment to anyone that requests it.

From: Don Pfister
Topic: 203 Message: 203

As I was thinking about this question, it occured to me - it was probably answered at the GPSL symposium. IF that is the case you can ignore it and I'll accept the consequences of my absence.

How are you making your PCBs? I have received boards from Paul and Mark. Their quality, and those I see on your various web pages, are outstanding. It has probably been 3 decades or so since I have tried making PCBs at home, yes it probably was in the 70s or 80s. I remember the quality not being that good.

IF you would care to share what software you use, etc. and possibly a quick procedure I would appreciate it.

Are any of you using that iron on PCB layout paper?

Thanks,
Don

I never could get anything out of the toner-transfer systems. I'm now using the photo-resist techniques from places like DigiKey and Jameco (among others). I think they're all about the same.

- Make a PCB transparency - I'm currently using DesignCad to do this, but am interested in switching to some auto-routing software.
- In a darkroom, sandwich the transparency over the coated PCB board and expose to a flourecent light for about 5 minutes (read the instructions)
- Dunk the PCB into a bath of developer for a few minutes
- Etch the board in a standard acid tank.

With this method, I've been getting almost perfect results down to .5mm width, and they claim you can go down to .13mm as I recall.

The darkroom part of it isn't terribly critical - I just wait until after dark and turn the lights of in part of the basement. You can use one of those orange bug lights to see - I have mine on a dimmer switch. I am using one of the 100W replacement bulbs (flourecent) in a small light fixture which I support a few inches over the PCB.

Hi Don,

I did a presentation on making PCBs at GPSL. I als have a step by step
guide on my web site at:

http://www.kd7lmo.net/tech_pcb.html

There is a list of vendors and software included.

I tried the iron on method before, but the quality wasn't that great.
There are a number of full size photo methods that work very well.
With the very low cost of 600 DPI printers, it is possible to create
some very high quality artwork with 8mil traces and 6mil spacing.

Good luck on your project and let us know how it works out.

This is the basic method I used in the past. What I used, in the past, was much the same, except, and this just came to me, for the photo transparency. My kit was made up of a photo resist ink and I used some dry transfer patterns. I never got clean lines, even going over it with the pen. Admittedly, I never dealt with the temperature or agitation like I was suppose to.

It has been decades, again with the decades - seem like everything was 30 to 40 years ago, I always seemed to have a darkroom set up. One nice thing when I lived in Denver, there were 'really nice' (professional grade) darkrooms you could rent - lots of fun memories there. ;-)

Zack, it sounds to me like I need to make the (what is it called?) reverse image transparency? Maybe I should buy the kits from DigiKey or Jameco instead of RS. ?

Thank you Zack! Any of the rest of you doing anything different?

Thanks all!
Don

You kind of lost me here (it's an easy thing to do ;-) Are you saying you print the 'full size photo artwork' and
then make a transparency out of it? OH, are you and Zack, saying you can print the artwork on transparency film
and use the photo (darkroom) method? I'm sure the answer is in the info you sent me, so if it is don't feel like
you need to reply. Sorry about this my fingers get to going and the brain lags behind. ;-)

209. modern PCB transparency creation

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-09 18:48:01 UTC
From: n1ltv
Topic: 203 Message: 209

> You kind of lost me here (it's an easy thing to do ;-) Are

> then make a transparency out of it? OH, are you and Zack,
> saying you can print the artwork on transparency film
> and use the photo (darkroom) method?

Don,

The big change is that the transparency (positive or negative, there are PCB emulsions of both varieties) is made full-size DIRECTLY on a transparent film right in the laser printer directly from the computer drawing program.

No photo imaging techniques required at all.

From that point the plastic film is "printed" "contact" style (1:1 film to PCB ratio) on the PCB by exposure to UV containing light and then treated and etched.

I started using the photo resist method in the mid 1960's and actually still have a COPPER laminate version of a picture of a Japanese model I made at a photo show. I should try to borrow a digital camera and take a picture of the copper. You can see the thread patterns in her traditional robe the resolution is so fine. Of course in those days there were no laser printers so the original 2 1/4 square negative was photographed on a litho negative, and then that negative (transparency) was contact printed on a PCB.

Printing and contact printing are photographic terms for those who haven't dabbled in photography.

Hank

210. Basic information needed about GPSL

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-09 18:51:17 UTC
From: n1ltv
Topic: 210 Message: 210

Fellow balloonatics,

Unless we want to advance the notion that ham radio ballooning is one of the most secretive activities within a hobby that already suffers in general from inadequate and misinformed press coverage, let's try to get some stories out about GPSL before it becomes stale news (no news).

A story writer would want to know at *least* the following:

1. Number of participants
2. Number of states or regions represented
3. Names of balloon groups attending
4. Names of presenters and subjects (in case it changed from the planned schedule)
5. Number and names of balloon groups launching
6. Number of balloons launched
7. Brief account of the launch (was it simultaneous or nearly so?)
8. Brief account of where the balloons landed and how the recovery went

Even as a balloon enthusiast, I have yet to find out much about of anything about any of these items (except as announced in advance planning), and what little I know came from Mark Conner regarding numbers 5 and 6.

Please help to make communication to the general ham population a task that is accomplished one tenth as well by ballooning as are its pure technical achievements.

Hank

> the parachute.

As Mark will attest, I'm always begging for this sort of information (sometimes even begging won't work) for the same reason as Bill, except it's for LIFTWIN which is based heavily on Bill's DOS methods.

The ascent rate from Bill's and my programs seems to be pretty good rough estimate, taking into account the fact that the ascent rate is not usually perfectly constant anyway.

I'd like to express my hunch on why these balloons do change speed in their rise to burst height:

Consistent with different behaviors of similar balloons in near identical air at GPSL, but something which I've been pondered for a while, I think the main mechanism in the variation of vertical speed is the change to a more spherical shape of the balloons as they ascend and become more highly inflated. The commonly observed slowdown with increasing altitude is consistent with the increased drag coefficient with the transition from a tear drop to a more spherical shape (less streamlined).

One thing that is a puzzle is that the GAINS embellished superpressure balloon recently launched from Oregon also experienced a small slowdown, and I was hoping we might hear what explanation that group might have for the phenomenon.

Thanks for filling in some of the gaps Hank! I think I got it. The light bulb started glowing with the "OH" in my previous email.

Let me see if I have this right.

Create traces (artwork pattern)
Print pattern on transparency film in the printer
sandwich (contact) the transparency and copper clad board.
expose to UV light
etch the board

Am I getting there? I guess I forgot to the put emulsion on the copper board, unless it already has it. ;-) I think most don't, but if I remember right, you can buy it that way, much like photo paper.

Do any of you find the agitation and/or temperature important in the new world? I have seen articles where guys (generic term not sexist term) put pumps in their tanks to handle the agitation. I understand it helps the detail etching. Again this was years ago.

Thanks all!

What's remarkable is that KA0JLF and N9XTN got about the same profile from substantially different trains. N9XTN used a single 800g balloon, while KA0JLF used one each of a 600g and 300g balloon. The 600g balloon was at the top of the train, with the 300g balloon about 10-15 ft below that, and another 10-15 ft to the payloads. The 300g balloon should have burst prior to the 600g balloon. It's possible that one of them burst at 1620 UTC, where the last handful of reports show a reduction to ~400 ft/min ascent.

Subject: [Ballooning] GPSL - Great Plains Super Launch

On July 5th and 6th, 2002 I attended the GPSL - Great Plain Super Launch. The GPSL was a two day Amateur High Altitude Ballooning Symposium held on the campus of Kansas State University.

The first day consisted of a number of presentations from various balloon groups on their payload packages, tracking and recovery procedures, rocket/balloon projects, and meteorology. I was fortunate enough to give two presentations. One on ANSR - Arizona Near Space Research and the second on the NSRV - Near Space Research Vehicle. The event was a great way to learn about other balloon programs around the country and to meet many of the people face to face in an informal setting.

On the second day, we launched six (6) balloons and their payloads at the same time. It was an incredible sight to see that many balloon in flight. Within a few hours, all the tracking teams recovered the payloads. Unlike Arizona, Kansas is mostly flat and there are farm roads on a one mile grid for miles and miles in all directions.

It would be nice to have ANSR launch a flight at next years GPSL, so mark your calendars and prepare for a road trip. And yes, you can bring your fireworks and firecrackers to Kansas.

Event photots:

From left to right in the bottom three images on the page:

HABITAT (2 balloons, 1 payload string)
EOSS
NSTAR
Traveler
KD0FW
TVNSP

I may have Traveler and KD0FW reversed - hard to tell. The red dot in the last photo is the PIBAL brought and released by EOSS.

Additionally, EOSS, KD0FW, and TVNSP all flew 1200g balloons to the best of my knowledge.

I must say, I was very pleased with the 600/300 gram combination. I will be doing more testing with this in the near future.

Please correct me if I'm wrong. I think Project Traveler used a 600 gram and Mark wasn't yours an 800 gram?

217. Group launches

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-09 22:16:02 UTC
From: Don Pfister
Topic: 217 Message: 217

Oh, let me say it was a Blast with all the groups. If ANY of you are interested in doing something like this again, please let me know. I hope to see all of you and more next year.

IMHO, 6 was MUCH, MUCH, MUCH more impressive than 3, as impressive as that was. AT this rate we need 12 groups next year to maintain the momentum. ;-)

Don

Currently, I plan at least 2 more (serious?) flights for this year. Hopefully more.

218. Balloon sizes

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-09 22:36:02 UTC
From: Mark Conner
Topic: 218 Message: 218

Yes, I did fly an 800. Here's a summary:

HABITAT: 600/300 combo
EOSS: 1200
NSTAR: 800
Traveler: 600
KD0FW: 1200
TVNSP: 1200

I used approx. 280 cu ft in my balloon. I used a full 240 cu ft tank
and about 400 psi (~1/6th) of another.

From: Zack Clobes
Topic: 203 Message: 219

I believe I bought my first setup from Jameco, and they were very helpful - even went and opened up a package to read the instructions to me. Since then I've been buying from Digikey because that's where I order 90% of my parts.

Subject: Re: [GPSL] Question

This is the basic method I used in the past. What I used, in the past, was much the same, except, and this just came to me, for the photo transparency. My kit was made up of a photo resist ink and I used some dry transfer patterns. I never got clean lines, even going over it with the pen. Admittedly, I never dealt with the temperature or agitation like I was suppose to.

It has been decades, again with the decades - seem like everything was 30 to 40 years ago, I always seemed to have a darkroom set up. One nice thing when I lived in Denver, there were 'really nice' (professional grade) darkrooms you could rent - lots of fun memories there. ;-)

Zack, it sounds to me like I need to make the (what is it called?) reverse image transparency? Maybe I should buy the kits from DigiKey or Jameco instead of RS.
?

Thank you Zack! Any of the rest of you doing anything different?

Thanks all!
Don

Is this the Group photo from the symposium or the launch?

More people are in the launch group, (like my group ;-), I think. Not as clear a shot tough (more distant).

Maybe we could match them in both eventually.

The symposium one. With this one it will be easier to
pick out people without any doubt.

If anyone can help ID the outside launch shot that's fine,
too.

224. NSTAR 02-D (GPSL 2002) Flight Summary

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-10 02:01:50 UTC
From: Mark Conner
Topic: 224 Message: 224

NSTAR Flight 02-D was one of six flights at the 2002 Great Plains Super Launch. Because of the forecast winds, the launch was moved from the Johnson Near Space Center about 8 miles southwest of Manhattan to the Herington Municipal Airport about 7 miles east of Herington.

The launch crews began arriving about 7am. A few of the local residents had come out to watch the launch, and some more came as the morning progressed. Skies were clear but hazy, with temps in the low 70s and quite humid. An occasional light breeze was out of the southeast.

We unloaded our equipment and began moving the helium tanks outside. Though we had permission to use the hangar, the ceiling and door were a little low and with the light winds it was quite suitable to launch outside. We spent a fair amount of time checking out payloads and began filling around 8:30am. Six groups flew on this morning - TVNSP, NSTAR, EOSS, Traveler, KD0FW, and HABITAT.

Mike KD0FW brought an old and rather unusual balloon. The balloon had a date code of 1980 and the latex was a very dark brown. However, it was still flexible and looked OK. There was a string running inside the balloon that was attached to the top and terminated in a plastic ring at the bottom.

A couple of minor problems soon cropped up. KD0FW's balloon took a decided turn for the worse. The balloon developed a bulge on one side and looked like an aneurysm ready to pop. Sometime a little after 9am the 22-year-old balloon gave out and with a snap released all its helium. Fortunately WB8ELK had his 1200g balloon that he couldn't use, so we were still able to fly his payload.

The other minor problem occurred while EOSS was filling. The hose came off the regulator and could not be reattached. With a combination of duct tape and another regulator assembly, they were also able to continue.

A little later, the wind began to pick up with some gusts to 10-15 knots. This spurred us to get moving a little faster and we walked the balloons into launch position around 9:30am. As our group winched our balloon out, I noticed that the shroud lines were not straight - the shroud ring needed turned around. I unhooked the payloads and got it sorted out after a few tense moments.

Finally, we were ready to go. Paul KD4STH did a "ready" call for all the groups and after a five-count, everyone let their payloads go at 9:42:30am CDT (+/- 5 sec). What a sight! All of the balloons drifted to the northwest as they rose into the hazy Kansas sky.

With a short chase expected, we had plenty of time to load our equipment. All the payloads were running fine and putting out good data. With 5 APRS

payloads on 144.34 MHz (KD0FW was tracked by DF only), it was a busy frequency! Three of the payloads were time slotted (EOSS, TVNSP, and NSTAR), while the other two (Traveler, HABITAT) were at intervals that would not consistently collide with the same payload. The sharing worked out well and we had plenty of data for tracking purposes.

Around 10:20am we left the launch site and headed towards Herington. We planned to stop at a gas station Street Atlas USA had promised us, but it had gone out of business. Fortunately there was a Dairy Queen next door and several stopped in for some snacks. We stayed at the Dairy Queen until about 10:50am, soon after Traveler had burst (the first of the day).

As we left Herington, it became apparent Traveler would be down well before the others, and that we could chase it to its landing and still have time to make the other landings. With the capsule reporting about once per minute, it was difficult to dead-reckon the reports into where to look. We chased north of Highway 4 on some gravel roads and pulled up parallel to Traveler's track about 1/2 mile to the west. To my knowledge, none of us saw it touch down at 11:11 am CDT.

Seeing that Traveler was in a relatively safe area with its own chase team going for the recovery, we then took a look at what else was happening. While we were chasing Traveler on its terminal descent, EOSS and TVNSP had b urst shortly before 11am. Both were coming down in close proximity to each other, with TVNSP about three minutes lower. We got back on Hwy 4 westbound and headed for Hope and then Elmo, KS. Enroute to Hope, we saw that NSTAR had burst at 11:25 at an altitude of 81,978 ft. With the light winds all from the SSE below about 30,000 ft, the end part of the chase was relatively easy. We turned north on Hwy 15 and began considering where to stop to see TVNSP land.

As we stopped on 15, TVNSP was crossing over the road and from the track looked as though it would land nearby. I got out of the car and was able to see TVNSP at about 1000 ft AGL. At times it appeared it would stop moving north, so I hopped the fence with my camera thinking maybe I could run a couple hundred yards and catch it. But then it took off to the north again and landed a few hundred yards away at 11:44am in what looked like a good area.

With the second payload on the ground, my attention turned to EOSS on nearly the same track. Since I had a good vantage point, I decided to stay in place and look for the EOSS payload. Sure enough, within a minute or two it was also visible and it landed a little farther away at 11:47am.

Now it was NSTAR's turn. Actually, it looked like it too would land not far away. Using the just-completed descents of the other two payloads, I surmised the landing would be west and a bit north of the EOSS landing. We went north to the next county road and then west a mile.

Suddenly, APRSPlus locked up on me with NSTAR still a couple of minutes from landing. I couldn't close the program and a bit later lost the OS. Great - a chance for another "catch" and I'm without data for the last few minutes.

Paul KC0KXR and Doug KA0O both had APRSPlus, so after some frantic running back and forth we made another adjustment for our vantage point.

We stopped on a gravel road on the next section boundary west of the EOSS and TVNSP landings and got out to look for the parachute. There it was! About 1000 feet up, off to our SSE and headed our way. The payload was descending in a spiral manner and I thought maybe it would come close enough to us to catch the power lines next to the road. But it stopped short and fell into a corn field about 100 yds east of the road at 12:02pm CDT.

We found the landowner and got permission to get the payload. Everything was intact and operating - the corn even kept the payloads from hitting the ground. After we got back, Mike W5VSI and Rick N0KKZ joined us. We took a few pictures and then got on the radio to find out where to go next.

Don KA0JLF's payload had also come down nearby, about 10 minutes before NSTAR did. We got a general description of where it was and drove off that direction. Shortly we got a packet of the landing position and parked on the road next to the field it landed in. Soon most everyone had arrived and Don went off in search of his payload, which was also found intact.

Now the only one left to deal with was Mike KD0FW's ATV and simplex repeater. EOSS, with its extensive DF experience was already on the job. As we moved back east, we tried to key up the simplex repeater on 147.585 in the hopes of having a stronger signal to DF. Others were listening on the ATV carrier frequency. Since there were plenty of vehicles in the hunt, those of us with vehicles capable of hauling helium tanks went back to the airport to move them closer to Manhattan and save some time for Paul on Monday.

After getting the tanks, we headed for Junction City to leave film at Wal-Mart and sat down to get something to drink. While waiting on the 1-hour photo job, we found out that Mike's package had been successfully located and everyone was arriving at Cracker Barrel for a mid-afternoon lunch.

As it turned out, we could have flown from JNSC if our payloads had followed the same profile. Traveler would have landed between Fort Riley and the Milford Reservoir, and the rest would have been a few miles west of the reservoir. But it still would not have been safe to do so.

225. Garmin GPS-35 HVS Mod - Repost

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-10 02:12:45 UTC
From: Harry M
Topic: 225 Message: 225

FYI

Just thought I'd share my GPS Mod page!

I added an internal preamp to my Garmin GPS-35HVS TracPak. This is the HVS (12v) version.
It is still in the vehicle and working great.

I must say, I was very pleased with the 600/300 gram combination. I will be doing more testing with this in the near future.

Please correct me if I'm wrong. I think Project Traveler used a 600 gram and Mark wasn't yours an 800 gram?

I can help some on the Symposium shot:

Outside left (from viewers standpoint) is Bob K0FPC Davis - with camera straps over shoulder. There is another gentleman between him and Paul. To Paul's left is Bill WB8ELK Brown. I don't remember the man's name with the beard (white). To his left is Doug KA0O Eubanks. To his left is K5IS, with N5IS in front of him. Next (to left of K5IS) is Marty (?) I think was his name tag. That's as far as I can recall in the back row.

In the front row to the far left in front of Paul, is Ralph. To his left is Harry KC5TRB M.(correct?)? To his left is K0ANI (correct?) (I think he was with NSTAR). I draw a blank next, but then it is Mark. And I don't recall the last gentleman. I'm not sure we met.

Sorry to those of you I didn't meet or if I got your name/call wrong. It was hectic at the launch for me and too many of you were too far way for me to see at dinner Saturday night. ;-)

My appologies to all. I am not trying to come off as a know it all or anything just a mental exercise - I sure need that. ;-) I'm sorry I didn't get to meet and speak with each of you. I would have liked to, and it would have helped that one brain cell that fires occationally. ;-)

You mentioned Mike Manes, I'm not sure who that is, can you point him out to me? Maybe that is the name I forgot? Between Bill and Doug?

I hope I got over 50% of the people I know right. ;-) That would be Bob, Paul, Bill, Ralph, Doug and Mark. ;-) Unless that brain cell dropped out again. ;-)

73 all!

If I could find it again, I would like to test the eyes and I have to keep that brain cell awake at least 10% of the time just because. ;-)

I would like to note, in addtion to Mark's fine commentary. Shortly after launch one of the balloons, and I couldn't id it, came up under Project Traveler's payload and bumped it aside. I believe Zack reported on this too.

While I didn't see it, I was to amazed at the mid-air I did see, ;-) I was later told that the two balloons bumped also, maybe twice even. Did anyone else see this?

I am guessing, from looking at the Excel sheets, that HABITAT SkyLab passed NSTAR on the way down? I seem to remember NSTAR bursting first. I am guessing this was due to the smaller chute and a faster decent rate? I'll have to look at the charts again.

Mark, was it the longer flight time that accounts for HABITAT being further west? Does anyone have the wind files from that day? By the time I thought about it they were already gone.

Ralph, I would like the email file attachment you offered, if you read this.

Thanks,
Don

Ok, on this one:
On the far left side, in the light blue shirt is Mike KD0FW and his wife Jackie (hope that is spelled right) in the white top. Ralph is in front of her kneeling (as a reference).

On the far right side, back row: I don't know who the first young man is but to his left, in the plaid shirt, is Andy W0AFQ Anderson. Next to Andy in the (GPSL 2001 and GPSL 2002 annual) vest - over the "HABITAT SkyLab" yellow team shirt (not GPSL 2002, that's why I got the vest ;-) is, Don KA0JLF Pfister (PFranc of KS, sorry about that ;-). Next to me also in the "HABITAT SkyLab - GPSL 2002" yellow team shirt is Charlie (nocall) Callahan. Next ot him (hiden) also in his "HABITAT SkyLab - GPSL 2002" yellow team shirt is Bob K0FPC Davis. Absent from our team (but he has the shirt ;-) is Dean (no call) Scott. (His grandmother passed away and the graveside service was Saturday). Unfortunately Andy joined us too late for Cris N0XZB Pfister (not in the photo but taking photos for us) to make his shirt. She had not only her "HABITAT SkyLab - GPSL 2002" yellow team shirt, but she also had her matching "HABITAT SkyLab - GPSL 2002" black team shorts. Can you tell she dressed us - figuratively that is. ;-)

I hope you all appreciate the humor I tried to put into that. Honestly, I (and I hope WE) really appreciated her inventiveness and giving attitude. (I think this should be worth one - "get out of the dog house" certificate). ;-) I sure need them as you can tell. ;-)

One thing I have been wanting to say, and I think this is a good time. IT WAS GREAT TO SEE ALL THE COUPLES! I'm not sure what the count was, but I think I count at least 7 if not 8 couples. I am sure I'm not the only one to say "Thanks" for that.

Don

I might note, what are you still reading this junk? It's from me why are you wasting your time reading this. ;-)
The little balloon chasers didn't get to make this flight due to prior commitments.

Ok, you are still reading so in a sense you asked for it. Two of our grandsons, Joey and Alex (brothers), have been on at least one of our chases, and in spirit several times. Here is a quick (ok too late for quick) story. I hope you enjoy,

cause I enjoy telling it.

When the boys parents were buying their house, the salesman gave the boys each a helium filled balloon. When walking to their car, Alex (the younger - 4 at the time I believe) lost his balloon. Up into the air it went and he started to cry. Older brother Joey (6 at the time if that brain cell is working at all), said "Alex you launched your balloon like Pawwa". Well the tears became a joyful grin. Next Joey turns to mom and dad and says "Hurry up! Let's go, we've got to go chase it!"

Enough for now. Okay too much. ;-)

Topic: 240 Message: 244

The long-standing source of surplus lithium battery packs is:

S&G Photographic
618 S. 62nd Street
Philadelphia, PA 19143
215-474-7663

Each package contains 10 lithium sulfur dioxide (LiSO2) cells that were manufactured by SAFT using the following model numbers:

Old military pack designation: BA-5513/U
Current military designation: BA-5590/U
SAFT cell model: LO26SX

Cells were manufactured in France. Packs were assembled in the USA.

Weight: 85g per cell
Maximum continuous current: 4000ma

At 240ma these cells are spec'ed for 7500mah; at 720ma, 5400mah.

These packs and cells were manufactured in 1986. If stored properly they should have been dependable for 10 years or 1996. Bench testing back in 1996 found them to exceed new cell spec's, e.g., they did not need to be derated due to age. Today, 6 years later, they are all suspect so one cell in each pack should be bench tested to depletion to understand energy capacity today.

Back in 1994 I paid $12.50 per pack for less than a case of 10 packs and $10.00 per pack for a full unopened case. Bill Brown replied on this net with the S&G URL and current price of $65/pack!

HOWEVER Fair Radio Sales, www.fairradio.com, has similar (but only 5 cells) LiSO2 packs in their current 2002 catalog for $4.00 each, 2 for $6.50, 24 for $50.00. These are military BB-5598/U packs with 1995 expiration dates (manufacture date October 1990). Each pack contains *FIVE* LiSO2 cells and are thoroughly discussed at http://www.pacificsites.com/~brooke/2577Battery.shtml. This appears to be a very good deal which is cheaper per cell than the original S&G price.

Typo alert. Make that $65 for -2- packs from S&G. Bill's info is correct.
Regardless, the Fair Radio offering is substantially less expensive.

Perhaps the reason S&G has radically increased their price is their Mini
Marvel flash battery pack that uses "2 D-Cell sized lithium batteries" and
sells for $50.

Thanks Bill, after a couple hours of searching - I get sidetracked easily - I only found the address on one of EOSS's page (thanks to them). I never did find a web page for S&G. Now I have it bookmarked.

I plan to fly my ATV (90 mw barefoot) on my next flight as a test of the ATV system. On a future flight I will fly my amp with it. This is mainly what I'm wanting the batteries for. So I should have some time to order them.

Thanks,
Don

First thanks for all the info Ralph. I bought my last packs from S&G, probably about 6 years ago. It seems to me, they said something then about their supply declining. Also, the supply not being renewable, so prices would go up as the supply ran down. The competing product probably only helps that. ;-)

> > Back in 1994 I paid $12.50 per pack for less than a case of 10 packs and

I think that is about when I bought my last ones, and about the same price. Maybe it was '95 or '96 and $15 a pack.

Anyway, thanks!

Update on names, etc., to symposium picture at
http://www.kd7lmo.net/images/gpsl1.jpg

Kneeling left-to-right:

Ralph Wallio, W0RPK Indianola, Iowa (HABET)
Harry Mueller, KC5TRB Tulsa, Oklahoma
Paul McCrone, KC0KXR Bellevue, Nebraska (NSTAR)
Jim Lamb, W5GAF Panhandle, Texas
Mark Conner, N9XTN Bellevue, Nebraska (NSTAR)
Michael Gray, KD7LMO Fountain Hills, Arizona (ANSR)

Standing left-to-right:

Bob Davis, K0FPC Overland Park, Kansas
Larry Cerney, K?ANI Denver, Colorado (EOSS)
Paul Verhage, KD4STH Caldwell, Idaho (TVNSP)
Bill Brown, WB8ELK Huntsville, Alabama
Chuck Crist, W9IH Indianapolis, Indiana (WINDTRAX)
Doug Eubanks, KA0O Bellevue, Nebraska (NSTAR)
Bobette Doerrie, N5IS Booker, Texas (REACH FOR SPACE)
Jerome Doerrie, K5IS Booker, Texas (REACH FOR SPACE)
Marty Griffin, WA0GEH Highlands Ranch, Colorado (EOSS)
Mary VanWinkle, KC5UNW Seiling, Oklahoma
Mike Manes, W5VS Littleton, Colorado (EOSS)
He unknown
Rick von Glahn, N?KKZ Parker, Colorado (EOSS)

Update on names, etc., for post-launch group picture at
http://members.cox.net/n9xtn/gpsl_2002_photos.html

Kneeling in front left-to-right:

Ralph Wallio, W0RPK Indianola, Iowa (HABET)
Three small children of TRAVELER (not kneeling) (names?)
Paul McCrone, KC0KXR Bellevue, Nebraska (NSTAR)
Ankur Verma, KSU graduate student of Civil Engineering
Paul Verhage, KD4STH Caldwell, Idaho (TVNSP)
Mark Conner, N9XTN Bellevue, Nebraska (NSTAR)
Doug Eubanks, KA0O Bellevue, Nebraska (NSTAR)

Standing in rear left-to-right:

Mike Bogard, KD0FW Independence, Missouri (KCATVG)
XYL Jackie Bogard (sp?)
XYL of Zack Clobes (name?)
Zack Clobes, W0ZC Hutchinson, Kansas (TRAVELER)

Brenda Riley, KC0HKU Hutchinson, Kansas (TRAVELER)
Jon Riley, AJ0NR Hutchinson, Kansas (TRAVELER)
Mary VanWinkle, KC5UNW Seiling, Oklahoma
Bill Brown, WB8ELK Huntsville, Alabama
Jerome Doerrie, K5IS Booker, Texas (REACH FOR SPACE)
Bobette Doerrie, N5IS Booker, Texas (REACH FOR SPACE)
Jim Lamb, W5GAF Panhandle, Texas
Local student (name?)
Bob Davis, K0FPC Overland Park, Kansas (HABITAT)
Marty Griffin, WA0GEH Highlands Ranch, Colorado (EOSS)
Charlie Callahan (HABITAT)
Don Pfister, KA0JLF Prairie Village, Kansas (HABITAT)
Andy Anderson, W0AFQ Lenexa, Kansas
He unknown

Please look close and offer additions and corrections.

Hello all.

I put a web page together with my photos from GPSL2002. Here's the link.

http://zephyr.unl.edu/~pmccrone/hamradio/GPSL/2002/

My APRS logs are linked at the end of this page. If you like any pix, feel
free to use them.

Topic: 256 Message: 256

I've uploaded a zip file to:
http://groups.yahoo.com/group/GPSL/files/GPSL2002Logs/N9XTNcompil
ation.zip

This has an Excel spreadsheet with the data broken out into
different worksheets, plus separate text files containing each
group's data. I was not able to exhaustively merge all the
telemetry data due to differences in time-stamping, etc. But the
position data is as complete as I could get it.

There are a couple of Street Atlas USA files in there too with
the tracks. I'll update the Excel file later on as I parse the
data.

Is anyone writing an article on the launch for a magazine. If not, then I'll start one. But I want to give someone else a chance first.

It will cost $8 to make and send a duplicate set of photos from my capsule. I had about 6 people say they wanted a set. Please confirm that you're still interested at $8 a set. It will take about a week to get them made and mailed.

What is the interest level in 2003? Are we interested in just launching? What about talks? the date is set for 5 July 2003. I'll at least arrange for a dinner on the 4th. There should be a fireworks display in Cico park that night.

I'd still like to hold GPSL 2003 in Kansas. Is this going to be a problem for anyone?

Here's a proposal I brought up at GPSL. I'm forwarding it to as many balloon groups as I can locate. Please look it over and let me know what you think.

I'd like to celebrate IGY's 50th birthday with a coordinated program of balloon and rocket launches.

I'm attaching the GPSL 2002 patch.

Don, can you pass this on to your wife and ask her to give us an estimate as to making an embroidered patch?

How many people would be interested in getting a GPSL patch?

Thanks,
Paul

Some of the EOSS group expressed interest in having GPSL 2003 in Colorado.
I would like to consider Colorado just to move it around, but ANSR will
probalby go where ever it is held.

Thanks again Paul for your efforts in putting GPSL 2002 together.

Hello all. I received a few emails regarding my web page - I guess some folks have had trouble with it. A couple things:

-The original page works best in Internet Explorer. It won't work well in Netscape.

- I guess the graphics are just too big for people on dial up. I put together a web page that links reduced size graphics files. It's not a fancy web page - it just gets you to the photos. It's linked below:

http://zephyr.unl.edu/~pmccrone/hamradio/GPSL/2002/small/

Thanks to Mark Conner-N9XTN- who had a software package that took all my big JPG files and reduced the file sizes easily. I was dreading doing this manually! Thanks Mark.

I talked to J.R. he said they ran an article with 3 photos. He wants to know how many copies we want and where to send them to. I told him I thought tear sheets were ok, not the whole issue, is that right?

How do you want to do this? You want them sent to me and then I will send them to you or should we just have them mail them out. I didn't ask about cost yet, I thought until we could answer how many, the cost wouldn't matter much. I'm afraid a qty would make a difference.

Let me know,
Don

Sending complete papers might be easier for them to do, as would sending them to one address. My thought would be to have them send a dozen or so to you and then we send you a couple of bucks to mail them individually to us.

I don't need the whole paper if they're willing to do the tear sheets, however.

Actually J.R. suggested the tear sheets.

Unless I hear different before tomorrow, I'll call and order 12 copies, that will be 2 copies per group (just a quick guess). Unless the price is outlandish. If the price is unexpected I'll consult the group again before
continuing.

277. T-Shirt Cost

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-18 18:34:23 UTC
From: paul.verhage@boiseschools.org
Topic: 277 Message: 277

If we order t-shirts, they'll cost about $28 each. These are t-shirts that are cotton on the inside and polyester on the outside (not your normal Hanes). The artwork is sublimated on, not screen printed. The level of deatail and color is much better this way.

Is anyone still interested in GPSL 2002 t-shirts when they cost $28?

From: n1ltv
Topic: 275 Message: 284

Paul,

I'd like to clarify what I think should be done w/r/t
writeups of GPSL.

In email to you I used the term "article" which may suggest
a fairly long piece, but at this point in the short term
I'm actually thinking of something more along the lines of
a press release which would summarize the high points of
the symposium.

My opinion is that this should issue from *you* specifically,
or someone who was in attendance at GPSL that you might
designate.

I feel this is a function of the event organizers that is
just about as important as getting the helium or returning
the empty cylinders. For days there was no word about even
such basic facts as how many balloons were launched and who
they belonged to. That led to my plea, saved as message
#210 on this list archive, for basic information about what
happened at GPSL 2002.

Since it seems nothing concrete has happened at this time
two weeks after the event, I'm going to reluctantly start
putting together short items for the AMSAT newsletter and
QST. As someone who wasn't even there, I feel this is not
ideal, but *someone* must start to do *something*.

I would urge that the news function be formalized for
GPSL2003. Let's not drop the ball a third time.

Just to remind, I cajoled a bit last year to get GPSL 2001
pictures to QST, and they along with a caption composed by
Mark Conner were published in a nice QST "Upfront."

QST will never guarantee anything, but I think they'll
go for at least one good picture. GPSL2002 has tons of
good pictures which is really helping to show what went
on.

Hank

From: paul.verhage@boiseschools.org
Topic: 289 Message: 289

I'm working on a QST article. I need some information for it.

As I recall, Bill Brown hitched a ride on a balloon. Was the other payload the one that was tracked with DFing, rather than APRS?

Who flew the DF'd capsule?

When was the DF'd capsule recovered? (I assume it was by 2:00 PM).

Bill, what was the date of your first launch?

Zack, did Bill fly on your spare balloon?

Paul

Paul,

Please read message 224 for Mark's account of NSTAR at
GPSL. The excerpt below from that message answers some
of your questions about the DF'd balloon.

Hank

Now the only one left to deal with was Mike KD0FW's ATV
and simplex repeater. EOSS, with its extensive DF experience
was already on the job. As we moved back east, we tried to
key up the simplex repeater on 147.585 in the hopes of having a
stronger signal to DF. Others were listening on the ATV carrier
frequency. Since there were plenty of vehicles in the hunt,
those of us with vehicles capable of hauling helium tanks went
back to the airport to move them closer to Manhattan and save
some time for Paul on Monday.

293. Re: [GPSL] Re: QST Article

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-20 02:58:04 UTC
From: Michael L. Bogard
Topic: 289 Message: 293

This is to answer a lot of emails that I got regarding the balloon package. If there are any unanswered questions please email me. The balloon that was DF'ed belonged to Mike Bogard with the Kansas City Amateur Television Group. This was my fourth balloon flight since 1990. I have only lost 1 balloon package as it was just designed to be a fox hunt but I think that a combine ate it as it has never been returned. Bill Brown WB8ELK did not fly anything as he had to work up to the last minute and fly in. I am not sure of the exact time that the capsule was found as it might have been 2:20pm. The payload had a old P.C. Electronics ATV transmitter driving a brick amp to about 4 to 5 watts out to a horizontal polarized mini wheel antenna. The ID'er was a WB8ELK elktronics 4 frame color id'er. I also had a second id'er (built by kb0znp) that was black and white that would come on and scroll my email address for those interested in a qsl. That timer also controlled a outside beeper to aid in recovery. There was a 2 meter simplex repeater that had a special cw id (built by wa0gwa). I also had a 35 mm camera snapping pictures every 10 minutes. The first balloon was a old kaysam from the national weather service middle 1980's and it looked a little funny when it was inflated. After a while it looked worse and burst. The second balloon was a 1200 totex balloon that Bill Brown got for me and we had about 11 pounds of lift. The package weight was 5 pounds and 8 ounces. The parachute was borrowed from Mark Conner. I had reports on the 2 meter simplex repeater from lower Kansas to the southwest corner of Missouri. The video was seen very well in these areas also. We also had a station in Kansas City receive the video and send it back out on the web so others interested could watch outside the viewable area and it worked great and had quite a few watching. That site was at http://pages.prodigy.net/dsudduth/javacampush.htm
Here is the site that has a few JPEG's and avi files that were recorded from the flight http://pages.prodigy.net/dsudduth/files/
The package was found about 22 miles due west of the launch site. The parachute was tangled with the balloon remains and shows signs of crashing pretty hard. The connector on the 2 meter simplex repeater had came out on impact and it shut off the simplex repeater. The impact also shattered to glass for the 35mm camera and moved it out of location. On impact most of the 440 ATV antenna was broke lose leaving just one signal to df the carrier on 439.245 and that is how it was found. It took some time and other people to track down my package but that is where the fun is. My wife even enjoyed herself! I am sorry now that I missed GPSL 2001. See you all next year de kd0fw Mike

From: wb8elk@aol.com
Topic: 295 Message: 295

Hi Paul,

WB8ELK FIRST FLIGHT

My first flight was from Findlay, Ohio on August 15, 1987 on my birthday (August 15th is also the birthday of fellow balloonatics Chuck Crist W9IH of WindTrax and also Joe Mayenschein WB9SBD from Wisconsin..there must be something about that birthdate!!). It was carrying an ATV transmitter on 439.25 MHz and a 50 milliwatt 2m transmitter on 144.34 MHz. I ran out of helium and ended up with 2 ounces of positive lift. It was a windy day and the payload barely lifted off the ground and travelled the entire length of a field (almost snagging on the corn several times) before finally taking to the air. It landed 25 miles to the northwest three hours later. The batteries had died in mid-flight and we relied on the oldest form of foxhunting....A REWARD sign. It was found 6 weeks later by a farmer as he was harvesting his soybeans.

KD0FW Flight at GPSL:

I basically just helped Mike Bogard KD0FW and Jackie Bogard launch their balloon (and chased it).....Although I have a garage filled with balloon payloads, I didn't bring one with me. I figured it wasn't a good idea to check baggage onto the airlines containing strange electronic components and lithium batteries. Perhaps next year, we can arrange a place to mail payloads for those of us who are flying to the launch? I thought about flying to GPSL on a balloon-powered lawn chair but getting those winds to cooperate is a problem.

KD0FW Flight:

We inflated a 22-year old Kaysam balloon first (the ugly one with a clear bulge in it). A short while after inflation it burst as I was holding it....we were able to obtain a spare Totex TA1200 balloon (I don't remember who gave us the spare balloon as it happened pretty fast - <hopefully they'll let us know on the list>).
Mike Bogard KD0FW and Jackie Bogard (callsign?) of Independence, MO flew the DF'ed payload. At launch I was holding the balloon and Mike was holding the payload....we were standing next to Paul's balloon.
The KD0FW payload consisted of ATV on 434 MHz and a simplex repeater on 147.585 MHz. Mike has flown 3 previous flights and chased many others and also enjoys tracking down radiosondes on 1680 MHz (+/- 10 MHz drift). He has found quite a few and it's good practice for balloon chasing (the opportunities are twice daily)...in fact it's quite a challenge since they drift wildly in frequency during flight. I've used a small Quagi on 1680 MHz that Mike built for me years ago and found several myself (I use an AOR3000A for the receiver in WFM mode).

Mike's simplex repeater's power connector came apart on landing so it was DF'ed solely on the ATV carrier. It was in the middle of a cow pasture about 3 miles southeast of where 3 of the other payloads had landed. The landowner's relatives came out to let us onto the property and one of them worked as a computer instructor at the local school. She was very excited about doing a balloon flight for her school and was interested in attending next year's GPSL. Bobette Doerrie N5IS of "Reach for Space" was going to email her particulars about the flight (Bobette has her class in Texas build small payloads and flies them as a school project).
We all had a great time tromping into the cow pasture and finding the payload (although a few hungry chiggers found me in the process - ouch). I did the final DF using my ears and following the Sonalert beeper. Mike and Jackie got drenched (Jackie got the worst of it) as a thunderstorm decided to hit just as we all were getting back to our cars. I very nearly got stuck in the mud as we were driving out....chunks of mud were periodically falling off the underside of my rental car all the way back to the airport in KC the next day.

- Bill Brown WB8ELK

PS...I'm going to upload my photos to my website over the weekend.

Paul,

You only list 9 states represented in your article. There were actually 11 states.
Your forgot Alabama, WB8ELK, Bill Brown territory, and,
Missouri, home territory to KD0FW, Mike Bogard.

Also, my last name has an "s" on it. EUBANKS

(Gee this is fun correcting a school teacher!)

Doug, KAØO

Subject: [GPSL] QST Article, first draft

Here's the first draft of the GPSL article for QST. Please look it
over for technical or historical errors or omissions. I still plan to
work on grammar, but if you see any glaring errors, please point
those out also.

I'll start putting something together for ATV Quarterly unless I hear
someone else is doing that.

Paul

Spelling error (should be "to") just after Zack's name - about the burst balloon replacement. Zack is with Project Traveler.

Paul, I'm not sure this fits with your idea, where you list the groups and their balloons, what about adding another column and listing the altitudes? I think I saw a chart of altitudes early after the flights. Just a thought.

Web sites of interest, did you want to include EOSS?

Just as a point of interest (maybe just of interest to me), my 6M simplex repeater capsule is the same one that flew in GPSL 2001. It was the same equipment, capsule - even the batteries I think. ;-) Those that remember, last year, will know this is one of capsules that were in a free fall for several thousand feet, when the capsules separated from the parachute. Other than a scratch on the front of the simplex repeater, there was no damage to this equipment.

Did you purposely leave out callsigns? Just a question.

Don

Don,

I think you're remembering my post to TVNSP list (and maybe
a few other lists). It didn't go here, so here's it is
from July 7 (a few extra words added here and there). Since
this was written, Paul has a peak altitude revised slightly
upward by a couple hundred feet from what is shown below.

Hank

July 7
---

meters feet

Paul 26796 87900 (87913)
Mike 26671 87500 (87503)
Don 26052 85500 (85472)
Mark* 24987 82000 (81978)
Zack 22167 72700 (72726)

*reported in feet and converted to meters

This is what I get from using the igated data of the highest
reported altitudes. I've shown the feet converted from meters
rounded to hundreds of feet to set an example of showing data
to a reasonable degree of precision but no more (the
down-to-the-foot figures are in parentheses for those who
insist, but it's not a good practice).

Paul and Mike are already within a remarkably close 400 feet
of each other, and Paul's igated figures suggest that his peak
was almost caught perfectly by the timing of the packet
transmissions. Mike's figures don't indicate a favorable timing
(although it can't be ruled out), so to my way of thinking Mike's
balloon in actuality may have edged out Paul's by as much as
several hundred feet.

I offer these comments just to illustrate there is a certain
approximation involved in pegging a balloon's height without

more frequent measurements of the balloon's altitude and with the limitations of GPS vertical accuracy. With this in mind, I think it's best to consider it a tie between the first two in the list.

The important point is that balloon altitudes by consumer GPS with coarse reporting (every 60 or 30 seconds) are really only accurate to within a hundred feet of absolute vertical position at best, and likely err by as much as 500 feet in the direction of underestimating altitude (because of the too infrequent measurement cycle).

Hank

308. Re: table of GPSL altitudes

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-22 19:05:48 UTC
From: n1ltv
Topic: 297 Message: 308

Paul 26796 87900 (87913)

Paul (revised) 88200 (88163)

Do I think this reporting precision issue is
worthwhile to discuss?

Yes.

Reporting to a reasonable precision and no more
shows that the investigator is informed and aware
of the shortcomings of his data collection methods.

If this kind of data were ever to make it to an
engineering or scientific publication, the altitude
figures stated down to the foot, at least without
some qualification, would go out the window. They
just wouldn't get by the editor.

I know it's natural to use all the digits if you
have them, but it's not good practice because
the implied precision is bogus.

Hank

Yes, I meant to come back to this but have been sidetracked. One of the things I have tried to do in the past was to capture the GPS data too. Mainly I was interested in the Satelite data, number, signal strength, 2D/3D fix etc.

One of my main interests is that GPS info. With all the balloons, and the inability to get my second beacon (GPS payload) running in time for the launch (later I realized I hooked up the RD instead of the TD line) I didn't fly the second beacon which would have sent the GPS data on a different band. Oh well there will be next year for GPSL. And another HABITAT SkyLab flight probably Aug. 3.

Sorry this was just a running off at the fingers (yet again, been a lot of that from me lately).

Thanks,
Hank

Don,

While you're around, inquiring minds would like to know
the weight of your GPSL HABITAT payload.

Surely you must be able to give a pretty good estimate
or actually drop it on a scale and weigh it. :)

Hank

I'm assuming the dew point at launch for GPSL must have been at least in the mid 60's. Mark, is there a record kept of this information? I've graphed the lapse rate as measured by my flight. I'd like get the dew point and see if the atmosphere was stable and until what altitudes.

316. GPSL 2002... GPSL 2003

Yahoo group: GPSL (2002 — 2008)
Date: 2002-07-27 20:30:29 UTC
From: K. Mark Caviezel
Topic: 316 Message: 316

All:
just now getting back on email after three weeks at
remote arctic outpost... congrats to all, looks like
it was a 100% super event!
As far as next year, Colorado is good, Kansas is good,
heck about anywhere is good. I was planning to
participate in GPSL 2002, but got opportunity to go to
the summer season of the Mars Society arctic research
station so I had to opt out. Maybe I could get some
Mars Society people to put up a balloon from the Devon
Island simultaneous with the main event.... with the
24 hour polar sunshine perhaps a floater could hang
around quite a while as they do at the south pole.
ahhh, just thoughts.... congrats again to all who
participated, sorry I had to miss it.

322. Balloon Ascent Speeds

Yahoo group: GPSL (2002 — 2008)
Date: 2002-08-09 18:05:30 UTC
From: paul.verhage@boiseschools.org
Topic: 322 Message: 322

In my book I discuss technical issues like the lift of helium, descent speeds of parachutes, cosmic rays, etc. The next topic I'm tackling is the ascent speed of a balloon. Here's what I have for my notes so far. I'm looking for input, because I don't have the complete picture yet. Please spend a little time looking these notes over and making suggestions. Thanks.

A. Intro

We know the balloon will expand as it rises due to decreasing air pressure. As a gas expands, as in a balloon, it cools. This cooling decreases the volume of a gas. We can see that during a flight that the balloon expands a lot more due to reduced air pressure than it contracts due to cooling air temperatures (both inside and outside the balloon). So cooling has a minor effect compared to reducing air pressure. The forces acting on a balloon are three, payload weight (W) pulling down, lift (L) pulling up, and drag (D) pulling in the direction opposite of the balloon's motion (so drag pulls down, just like the weight). Looking at flight data, we see that the balloon ascends at a constant rate for the entire flight [1]. As long as there is no net force acting on a balloon (or any object for that manner), it moves with zero acceleration, or constant velocity. Since the balloon climbs at a constant veleocity, the force of lift of the balloon is balanced by drag and weight, D + W = L. Lift and weight are constant on a balloon flight [2], therefore the force of drag must be a constant throughout the flight also.

B. Drag

The equation for drag is given as,
D = Cd * Ra * sq(V)/2 * rho

where,
Cd is a coefficient of drag
Ra is the reference area
sq(V)/2 is the square of the velocity, divided by 2
rho is the density of the air.

Cd is a dimensionaless constant. This means it's simply a number and does not have any units (like pounds or feet) attached to it. For a sphere, Cd is about 0.5

Ra is an area you choose to use. If you select a different area as your Ra, then the Cd for that Ra is different, but Cd is still just a number

I only what to determine how ascent speed changes as the variables change, so I'm going to treat this equation as a relationship of proportionality and drop the constants for the rest of this discussion.

When you look at the US Standard Atmosphere (a model of how air pressure, density, and temperature change as a function of altitude), you see that the change in air density closely tracks the change in air pressure. So I'm going to replace air density with air pressure. The reason I do this is that we can see the change in air pressure changes the balloon's volume and therefore it's reference area. As a Ra, I'm going to select the frontal area occupied by the balloon. This Ra is proportional to the two-thirds power of the volume. The balloon's volume, ideally, is proportional to the inverse of the air pressure. Observations show that the balloon's vertical velocity, its ascent rate, is constant throughout a flight. So sq(V)/2 is also a constant. When I combine like terms and move the constants out, I end up with the following,

D is proportional to (volume)^2/3 * pressure

Which simplifies to

D pro to 1/(pressure)^2/3 * pressure

Which simplified to

D pro to (pressure)^1/3

However, D must be a constant, whereas pressure is not a constant! So what's wrong here?

The change in temperature can't be responsible for adjusting the change in volume (that is due to changing air pressure) because we see the temperature change in opposite direction in the tropo and stratosphere. And yet, the ascent rates in both the tropo and stratosphere are both constant.

So it appears to me that Cd is not a constant throughout a flight.

C. Cd

Cd models drag's depenedencies on things like shape, air viscosity, and air compressibility. The balloon's shape does not change significantly during a flight. The air compressiblity is not siginificant belows speeds of 200 mph. This leaves only air viscosity. Is the change in the air's viscosity proportional to the cube root of the air's pressure? If so, the change in Cd would oppose the chnage in drag caused by the change in air pressure (or more exactly, air density). Does the Cd of an aircraft change as the aircraft climbs?

Note 1
There is a knee in the ascent speed of a balloon as you approach

the stratosphere. In the startosphere, the air temperature increases as the balloon climbs. Perhaps the slight extra increase in the balloon's diameter due to increasing stratospheric temperatures increases the balloon's drag slightly, causing it to slow down a bit. As a future experiment, does a black balloon rise faster than an identical white balloon or slower?

Note 2
The lifting ability of helium does decrease with decreasing pressure. But this amounts to only something like a percent or two. This is not enough to significantly effect our numbers.

Paul

323. Re: [GPSL] Herington newspaper

Topic: 236 Message: 323

After my forgetfullness, I did contact J.R. again yesterday - thanks to kd0fw reminding me. He was going to check and see how many copies he had and send me upto 24. He was going to call me back but I didn't get a call or message.

I will follow up on this. I will mail copies to those of you that have told me you wanted one (or more). I hope to mail copies out next week.

I found out they are $1 each plus postage. They charge the price of the paper ($1 an issue) even for the tear sheets. To avoid the additional postage/shipping I just got tear sheets.

More later, let me know if you have any questions. Oh, Mark in answer to your question yes that is the paper but the area code changed to 785 like Doug said.

IF this list isn't everyone, please pass this on to your groups or lists.

Don

HABITAT SkyLab is scheduled to launch a balloon at the Herrrington Airport Open House at 10 a.m.

Hank, I will post on HABLIC.

I'll provide more info as it becomes available.

Mark and Zack, last I knew, were both planning a launch that date too. I talked to Zack yesterday at the Salina HamFest. Mark, I seem to remember a schedule conflict that might have you move your flight, any word on that?

I have a video clip showing the launch and the view at various altitudes at the following site:

http://68.13.112.250:14480/NSTAR02D/NSTAR02D.wmv

The clip is about 12 Mbytes and 5 minutes. This server should be able to uplink at about 128 kbits/sec, but I've been told it's not that fast at times. If you do download the movie on a broadband connection, please send me a short note with the bandwidth you got from me.

336. ARHAB Records - 2002 Q4 update

Yahoo group: GPSL (2002 — 2008)
Date: 2002-12-31 14:01:22 UTC
From: Ralph Wallio, W0RPK
Topic: 336 Message: 336

My thanks to everyone for another great year of Amateur Radio High Altitude Ballooning! We established seven new 1-2-3 records in 2002. Rumor has it we will see even more in 2003. Keep 'em coming folks. Record entries define our collective state-of-the-art.

Note that *Ratio of Released v. Recovered Payloads* has been changed to *Total Missions Flown*. New entries and revised counts are encouraged.

See http://users.crosspaths.net/wallio/RECORDS.html for all record entries and details.

Subject: [tvnsp] GPSL 2003

Mike of EOSS is trying to line up GPSL in conjuction with another activity with the Colorado Space Grant. If this goes through, then GPSL 2003 will be held in the Denver area on 21 June. I need to get an idea of how many people think they can attend this. GPSL 2003 should be another two day event, with Friday set aside as a symposium and launches on Saturday morning. I'd like to line up crews to help with the launch and recovery, so a few people need to bring their mobile trackers.

Speak up!

Thanks,
Paul

One thing that comes to my mind is "GPSL" stands for "Great Plains Super Launch" is west of the Colorado plains still part of the "Great Plains"? Just a question.

I've heard from some local groups that they will not be able to make that trip to CO. There was some discussion about local groups launching near here, at the same time as the western groups, and trying a link experiment or something.

After the western support last year, to make GPSL 2002 a great success, I will offer my support the best I can.

> Isn't Paul on these lists?

I'm here.

If GPSL 2003 is held in Colorado, EOSS will sponsor it. If it's held in Kansas, then I'll sponsor it.

At last year's GPSL, Mike Manes of EOSS asked about having them sponsor GPSL this year. I was a little hesitant at first, but at some time your children need to leave home.

Besides, I should be able to get more TVNSP support if it's in Colorado.

Paul

ANSR will be able to attend the Colorado based GPSL 2003. Colorado is a little easier because it is near a major airport vs. 2.5 hour drive. It is also less humid and they have Star Bucks. :) I'd also vote for the symposium. It makes it a little easier to justify the trip.

If the winds are strong enough, it'll be the "Great Plains Super Landing" instead.

Marty's message to EOSS made me think of this.

Do we want to add contests to GPSL?
Perhaps highest flight or closest predicted landing.

Paul you have HABITAT SkyLab's second or third launch listed as the first. Our first was in 1997, but I'll have to look at the video to see when it was. I think like in September and or October.

The one you listed was the one you attended, which was our second or third - something like that. I'll try to get videos out this weekend (I'll be working on video anyway) and get back to you.

Also, again I'll have to check - unless Bill N3KKM remembers (or someone else) - Bill flew his capsule with ours on one or two flights before flying solo. I think Mark did this (piggy back new capsule on experienced one) with Bill too. This seemed like a good practice if possible. ;-)

Oh, any idea if GPSL 1 was the first 6M simplex repeater flight? I flew one then, not sure I had heard of any before that. Do you want that kind of stuff too?

Hi Paul,

I flew a crossband repeater (440 in and 10m AM and 2m FM out) and also a simplex repeater back in 1991 while I was living in Peterborough, NH....I'll dig into my records and get you exact dates. I found the simplex repeater in the bottom of an 80 foot-deep stone quarry (one of several flights that I launched by myself and found by myself)...as you can imagine it was very difficult to even locate the signal in the first place...I got very lucky.

Topic: 337 Message: 354

Ok, I sit corrected. ;-) I was thinking the suggested site was West of Denver.

I did mention the plains extend to Eastern CO, I just didn't remember how far west Eastern CO went. ;-) I guess we were both right, just that I was thinking farther West. What is that old saying "you don't have to understand something to argue about it"? :-) I didn't mean to argue.

As I recall (sitting here on my brains and not checking again) - it has been several years - Denver could be considered the 'High Plains', the mountains don't really start until you get a few miles west. ;-)

I will have to get a map out, I keep reading about Deer Trail but don't remember seeing that.

Yes a landing in the mountains concerns me too - but what can you expect I'm a flatlander again. ;-)

I hope to make it but it's still a ways off. The date concerns me, the earlier mentioned date might have been doable (time wise) but the newer date is going to conflict with a previous commitment I'm afraid. I have two riders after me to crew for them during this years RAAM 2003 (http://raceacrossamerica.org/raam2003/raam2003main.htm there is a link on my HABITAT SkyLab page to a photo of me at the starting area for RAAM 2002). It is scheduled for June 15 to June 27. My local friend Byron is going to ride as one of a 2 man team. My Italian friend Fabio is riding as a solo. I crewed for both of them last year. I started with Fabio - when he dropped I joined Byron's crew team.

In between I got to spend about 3 days in the beautiful Aspen, CO area. ;-)

Byron, had agreed to get me to Denver for GPSL 2003 - flying me from the East Coast to Denver. However, that would leave me with out a balloon or equipment (which could be overcome). The plan is to be in San Diego on Sunday the 15th to watch (and support) the Solo riders start. I guess this might work - fly to Denver for GPSL then fly from Denver to San Diego for the start of RAAM (I might even get to see my nephews family - he just got back from deployment in the P. gulf). I'll check with people. ;-) Since I will be using my mobile APRS stuff for RAAM too - I'll have it all with me. Hmm... If none of the rest of my crew can make it, this would make me a solo and possibly no wheels. Probably more trouble than it is worth. We'll see.

Thanks for the Geography lesson (and corrections) Mike! I appreciate it.

I'll see what we can do. I can't commit 100% either way. Please keep me updated on plans.

Don

Good thing I asked for clarification. ;-)

Actually, I just wanted you all to know another HABITAT SkyLab team member just passed his Technician Test this morning. Charles "Charlie" Callahan should get his license issued around next Thursday (according to the VEs giving his test).

Welcome to HAM RADIO Charlie! OH he also won a door prize at the St. Joe, MO hamfest (his first hamfest). ;-)

Hi Paul,

Yes. Let's plan it for 13-15 June '03. Chris Koehler has agreed to supply a venue at the CU Boulder campus for our Friday meeting, and I'll arrange for a launch site in Deer Trail for Sat (backup Sunday).

What sort of meeting times work for you? I think that a 0900 launch is workable. And I think that I can line up discount room rates not too far from the meeting site (although Boulder per se is $$$!).

Once we get some attending flights confirmed, EOSS can also arrange for He on site, as you did last year. And EOSS will also handle the FAA position reports (Deer Trail is just outside DIA Class A airspace).

Hi Harry,

Sorry to hear you have a schedule conflict. I do know how tough it
is to reserve a cabin or even a campsite at the GC. But do drop by
if you can when you come thru Denver - we're a mere 50 miles W of
Deer Trail on I-70 / I-25 :=}

Subject: Re: [tvnsp] Today's Day in History

Hi Paul,

Yes. Let's plan it for 13-15 June '03. Chris Koehler has agreed to supply a venue at the CU Boulder campus for our Friday meeting, and I'll arrange for a launch site in Deer Trail for Sat (backup Sunday).

What sort of meeting times work for you? I think that a 0900 launch is workable. And I think that I can line up discount room rates not too far from the meeting site (although Boulder per se is $$$!).

Once we get some attending flights confirmed, EOSS can also arrange for He on site, as you did last year. And EOSS will also handle the FAA position reports (Deer Trail is just outside DIA Class A airspace).

Hi Don,

Well, don't sweat the bit about nbot knowing the eastern half of
Colo being a plain - the Visitors' Bureau doesn't advertise that part
much :=}. So if you win a free vacation to Club Med Hugo, CO, don't
bother waxing up the skis.

Sounds like a pretty messy itinerary. I hope maybe you can get
some of your HABITAT cohorts to bring out a balloon and payload, tho.
If not, then we'd still sure love to see you again and put you to work
on the launch and/or recovery crews. The Spacegrant folks might be
grateful for any help they can get assembing the payload strings as
well.

BTW, wot's RAAM? A balloon race?

Hi Ralph,

Yep! You got the details down pat. And you've given me the proper cage-rattle to round up motel and RV park sites near Boulder and a spot for dinner Friday evening. Been gill-deep in some new EOSS payloads.

Looking forward to working with you again. BTW, will you be flying a balloon this time?

Hi Ralph,

I hope you'll stick around long enough to watch the launch and
chat with some of the students. In fact, if you can spare an hour
or so, we'd be delighted if you could participate with the tracking
and recovery crews - the landing sites may not be too far away from
your route home.

Anything on the schedule?

I'd like to present on the flights of Explorer 1 and 2.

I may be short handed again, so will need help getting my capsule airborne.

Paul

Hi Paul,

Sorry for slow reply -- been up to gills in getting EOSS-64 up and off. It was a huge success, BTW, despite Murphy's getting his digs in. The FAA was delighted with the findu.com reporting of both the payload and balloon APRS beacons. This is a real advance for amateur ballooning's relationship with the FAA. I hope Russ Chadwick will be willing to present on it at GPSL as well.

And yes, the program's started forming with your proposal, Paul. And EOSS should have plenty of extra folks on hand to help you with your launch - I assume you'll be needing He? How much?

From: Mike Manes
Topic: 345 Message: 366

Hi Mike,

Well, as I mentioned to Paul, the agenda is forming as folks step forward with material they'd like to present. So far, we have Paul's bit on his Traveler flights, and I'm hoping that Russ KB0TVJ will talk about the new FAA reporting feature on findu.com. I could do a show & tell on some of our new payloads, e.g. the despun ATV. EOSS could also cover some of the more interesting flights we'll have flown since the last GPSL, e.g GAINS and Big Blue.

I'd think that the group would be eager to learn more about your glider and how you've been dealing with FAA Seattle's concerns related to the "Predator" ROA requirements.

Incidentally, I'm not real certain who's on this reflector right now, and how many others balloon groups plan to attend the conference and/or the flight. Ralph Wallio does plan on a cameo appearance, however; perhaps he can be persuaded to delight us further!

From: Mike Manes
Topic: 345 Message: 367

Hi Mike,

Any of those topics are likely to be of interest to the group. Since
only two folks have stepped up so far with presentations, I'm
reluctant to set a time limit on any single presentation, however.
But I sure don't want to drag the Friday session out too late, since
the launch site is about 80 miles from Boulder, and I hope to get the
launch off by 0900 Saturday.

BTW, I expect ANSR to be operating one of the three CU Workshop flight
strings. You'll have about 5 lb weight budget for your own beacons.
How much He should we have on hand for ya?

Re the ROA:
I filed for a waiver with FAA Seattle for the EOSS-66 / U Ky Big Blue
glider, since it weighs in at about 15#. I got a call back from
a Gordy Burnet, who cited a 1999 ruling from FAA brass related to
flights of ROAs (formerly UAVs) in civil airspace. Among the reqmts
are an altitude-reporting transponder, navigation lights & strobe,
and full hemisphere visualization and real-time control by the
ground operator for VFR collision avoidance. Ref FAA Notice N 7610.71.
These requirements are reasonable for a USAF "Predator", but off the
wall for a 15# model aeroplane. The rule of unintended consequences?

Now, if you can keep your glider under 6 lb, you won't face the FAA
scrutiny, but that doesn't change the fact that the rule is in place,
regardless of FAR-101.

We're still negotiating with Seattle, but the best we might hope for
would be a parachute descent below 60K'.

Date: 2003-04-05 09:38:24 UTC
From: Michael Gray
Topic: 345 Message: 368

Mike,

I'll step forward and offer the following presentations, but feel free to alter them to suit the schedule and group.

Introduction
I have a 15 minute edited DVD that shows all aspects of high altitude ballooning. We use it as a general introduction to ballooning. It might make a good opening to the proceedings for those who may not be familiar with our hobby.

Session 1 - Topics in Electronics and Software (45-60 minutes)
A. In-flight landing prediction (we typically get an estimate of < 0.5 miles at 100,000')
B. Compact-light weight APRS Beacon design
C. IRLP/cross band repeaters
D. SSTV from the 70s revisited in digital

Session 2 - NSRV (Near Space Return Vehicle) (45-60 minutes)
A. Flight data from powered UAV
B. Control systems and electronics
C. Flight data from balloon flight (we will fly before June)

I've given the presentations a number of times, so I can change the length to suit your schedule.

Thanks for the FAA information. I am working the issue at our end. Hopefully we'll have a better outcome. A parachute descent from 60,000' doesn't really do us much good.

73s de Michael Gray, ANSR

369. My plans for GPSL2003

Yahoo group: GPSL (2002 — 2008)
Date: 2003-04-06 14:13:00 UTC
From: Ralph Wallio, W0RPK
Topic: 369 Message: 369

Schedule for my 'cameo appearance' at GPSL2003. We, wife Sharon, daughter Steph and self, will arrive in Boulder Thursday afternoon, June 12th, from Salt Lake City via the University of Wyoming at Laramie. We will leave the area Saturday morning via the launch site at Deer Trail to arrive in Lawrence, Kansas late that afternoon.

I/we will be available for an informal gathering and meal in Boulder on Thursday evening, paper presentations and discussion on Friday at CU-Boulder, a more formal meal on Friday evening in Boulder and the launch from Deer Trail on Saturday morning. I will not be flying a mission or payload.

On Friday I could present paper(s) on --

Solar Floater (see http://users.crosspaths.net/wallio/SolarFloater.html) which I still hope to fly for the first time in May

Radio Mobile Deluxe payload communications footprint predictions (see http://users.crosspaths.net/wallio/Radio%20Mobile.html)

Link Budget Analysis (see http://users.crosspaths.net/~wallio/LINKbudg.html)

Predictions from Mean Zonal Winds (see http://users.crosspaths.net/~wallio/MZW.html)

Packet Radio Bit Error Rate (see http://users.crosspaths.net/~wallio/ber.html)

and/or lead a discussion about our collective Amateur Radio High Altitude Ballooning Records (see http://users.crosspaths.net/wallio/RECORDS.html)

You folks vote on which, if any, you want to be amused, bored and/or entertained about.

On Saturday morning I could be our official kibitzer to the public, students, et al., that may need an explanation or two during preparations and launch (after which we will be heading east on I70).

Paul,

I am putting together the Spring issue of ATVQ. Do you want to give me more details of GPSL 2003 to publish. Otherwise, I will publish what little I have. I need it by next Friday at the latest.

Thanks, Russ. Sounds like an interesting conference session is
forming up. How much time do you think you'll need?

BTW, you might consider getting on the GPSL reflector - it's another
yahoogroups service.

Hi Mike,

You might want to consider the background of the audience in putting
your presentations together. SO far, I don't have a complete roster
of attendees (at least I >hope< I don't!) - but it'll be EOSS types,
Paul V. of TVNSP, Ralph W. and the ANSR team. Not sure how I can
solicit for more balloon group attendees, but some have already bailed.

Good luck with that FAA issue. I'll be in a teleconference tomorrow
with FAA and U Ky to nail down the details. In the meantime, you may
want to dredge thru the FAA sites looking for FAA Order 7610.4, which
is the parent document to notice I mentioned earlier.

Either that, or engage in weight reduction program! To that end, I've
coined a new acronym as a cousin to KISS: KILL, for Keep It Light,
Lunkhead! (You heard it here first -- :=}

Sorry Paul. I did go back thru the 3800+ msgs in the Inbox to
find ur topic, but gave up. Explorer it is! Thanks.

We have some EOSS folks lining up lodging venues, and CU has offered
their rate walking distance from the campus GPSL venue for $69/nite
for single or double. There's cheaper farther out I'm sure, but this
ain't bad for Boulder.

So far, we have TVNSP, ANSR, EOSS and Raplh Wallio aboard and
presenting.
Any suggestions re how to promote GPSL 2003 more widely? I know you
did a great job on this for GPSL 2002. I'm not on all the balloon
reflectors, but on enough to make a nuisance of myself with duplicates.

> did a great job on this for GPSL 2002. I'm not on all the balloon
> reflectors, but on enough to make a nuisance of myself with duplicates.
>

Two thoughts immediately come to mind:

First, I have a long list of e-mail addresses including lists at http://users.crosspaths.net/~wallio/HABLinks.html. A short announcement could be sent to numerous selected addresses with basic information and a link to http://www.eoss.org/gpsl2003/ for further and updated information.

I subscribe to all known lists but I have not seen any GPSL2003 discussion on most. It is my understanding that GPSL2003 will be held in conjunction with the 2nd CU Space Grant Consortium Workshop. I do not find any information on the workshop in Colorado Space Grant web pages let alone reference to GPSL2003.

If EOSS will write the short announcement I will volunteer to send it. Multiple receptions of a short message is not a problem.

Second, we should send the announcement directly to all GPSL2002 attendees because they are prime candidates to attend GPSL2003. It should also be sent to ARRL, QRZ, and other points of dissemination.

While I think of it:

Mark Conner, N9XTN, is expecting a harmonic close to our GPSL2003 date and will not be with us. However, he is planning on flying an NSTAR mission close to home at the same time as our multiple launch from Deer Trail. This would be a significant opportunity for EBBE and should be publicized.

I'm not running this year's GPSL, it's EOSS's turn. I'll pass the word on to Mike Manes.

We are hosting a Northwest Super Launch (NWSL) for Memorial Day weekeend, here in southwestern Idaho. If anyone is interested in attending, please ask them to email me. The details are still be worked out.

Thanks,
Paul

There's a KOA about an hour east that I'll camp at.

Gene Harlan is very interested to know about GPSL and will
publish info on it. He'll need info by Friday. Can we get something
in QST? Isn't there a ARRL audio message that goes out once a
week? I'll see if anyone here can tell me about it. Perhaps we can
put a message out there and on the ARRL webpage. AMSAT also
has a page reserved for ballooning.

We had problems last year getting the word out and any
advertisement. I tried contacting Gordon Wset of Nuts and Volts
magazine. He expressed some interest, but never showed up or
wrote anything. It might be a good idea to try him again.

I'll keep thinking about this.

Hi GPSLres,

Thanks to Ralph for offering his vast library of valuable ballooning info. Do any of you have any special preferences? If so, let the group and Ralph know -- I think we can give him 2 hours, based on the present attendance on record.

382. Re: [GPSL] Re: GPSL 2003

Yahoo group: GPSL (2002 — 2008)
Date: 2003-04-08 23:20:31 UTC
From: Mike Manes
Topic: 345 Message: 382

Hi Gene,

Hey! Thanks for the generous offer! I assume that this will be
published
in the "coming events" section?

Here's what I know - may be no more than what you already have:

Great Plains Super Launch 2003 - the 3rd annual convocation of ham
radio high altitude balloon groups. This year's GPSL is sponsored
by Edge of Space Sciences <www.eoss.org> and will be held in
conjunction with the University of Colorado Space Grant College
BalloonSat Workshop.

The GPSL Conference will be held on the campus of U. Colo from 10AM
to 5PM on Friday, June 14, 2003. The conference program is just
now coming together, but will include presentations on the TVNSP
Explorer balloon payloads, the latest developments at ANSR and
the newly-developed FAA position reporting feature based on I-gated
APRS beacons. The specific conference room is TBD but will be posted
on www.eoss.org in a few weeks. A dinner will be held afterwards at
a nearby eatery.

Early Saturday AM, June 15, the GPSL crews will head east on I-70 to
the town of Deer Trail CO, where they will prepare to launch at
least three balloons carrying small experimental packages, or
"BalloonSats", designed and built by the 50-odd CU Workshop attendees
from NASA Space Grant Colleges from all over the US. Balloon teams
from EOSS, TVNSP and ANSR will conduct the launch, tracking and
recovery operations, using their own APRS and DF tracking beacons.

If the Saturday winds or weather are unsuitable, the launches will be
postponed to Sunday 16 June.

All interested amateurs are warmly invited to attend this exciting
event. Check www.eoss.org for the latest GPSL information.

Hi Phil,

Forgot that you're out of Michigan - pretty long trip out this way.
Good luck on MABEL 3! Maybe get an eyeball after you retire?

Topic: 376 Message: 384

Hi Ralph,

Hey! THanks for the offer to get the word out! If I'd know that
EOSS was gonna get requests for some 14 launches this year, I'd
not have been so free to volunteer to host GPSL. So any help
will be most sincerely appreciated! Some day, maybe I'll find
out what retirement's >supposed< to be like!

You may have seen the blurb I sent Gene Harlan for ATVQ. If not, here
it is again. ANd Rick N0KKZ sez that the "official" web site is
www.gpsl.eoss.org or www.eoss.org\gpsl.

Not sure when Chris K is gonna get his site updated - will ask
him next weekend during EOSS-65.

From: Mike Manes
Topic: 380 Message: 385

Hi Paul,

Yes, in a sense. Chris Koehler has developed a one-semester undergrad course at CU called "Gateway to Space", where the kids get their feet wet in aerospace engineering. Teams of 5 or so students design and built "balloonsats" which EOSS flies and recovers. The balloonsat log flight data in Hobos, so recovery is essential.

Last year, Chris and CU SGC did a seminar for all the US Space Grant Colleges on how to develop this kind of course at their schools. The attendees build balloonsats from kits, some 20 or so, and EOSS along with Ia State and Mt State flew 'em on three flight strings.

GPSL 2003 is that same seminar, and once again EOSS will fly one of the three strings of balloonsats. This year, Ia State won't attend, so we're relying on ANSR, MT State and TVNSP to split the ballonsats, fly 'em and get 'em back.

Hi Paul,

Not sure who's on this GPSL reflector, but I've posted a couple of
general inquiries, and Ralph, TVNSP, ANSR and EOSS are the only ones
who have confirmed their intent to join us.

So .... who did I miss?

Re QST et al: I did get Gene something for ATVQ, and Ralph has genrously
offered to post the word to his rather thorough list of reflectors.
Not sure how to get something in QST, but Jeff Ryan K0RM, the Colo
ARLL SM and a valued supporter of EOSS's activities in Colo Springs,
may have some ideas.

OK on the KOA. You make me feel like a real homebody - but my ol'
bod's just not up to a good snooze in anthing but a comfy bed :=|.

Thanks!

389. Speakers Tell me ...

Yahoo group: GPSL (2002 — 2008)
Date: 2003-04-11 20:59:30 UTC
From: Rick von Glahn
Topic: 374 Message: 389

I've been trying to get some information posted on the GPSL 2003 website.

http://gpsl.eoss.org

If you are a speaker please visit:

http://www.eoss.org/gpsl/speakers.htm

And tell me if I've made any mistakes or left anything out.

And also check:

http://www.eoss.org/gpsl/forums.htm

And tell me if I've correctly outlined your presentation.

If you go there now, you'll find nothing! So, if you are a speaker, perhaps you could send along a paragraph or two outlining your proposed presentation.

Please feel encouraged to check out the rest of the site and offer any suggestions, corrections etc. so that this site can become accurate and informative for visitors planning to attend the event.

Thanks.

390. GPSL2003 - Boulder - June 13-15

Yahoo group: GPSL (2002 — 2008)
Date: 2003-04-12 11:40:15 UTC
From: Ralph Wallio, W0RPK
Topic: 390 Message: 390

Announcing Great Plains Super Launch 2003 - the 3rd annual gathering of Amateur Radio high altitude balloonists. This year's GPSL is hosted by Edge of Space Sciences www.eoss.org and will be held in conjunction with the 2nd Colorado Space Grant Consortium BalloonSat Workshop http://spacegrant.colorado.edu/studentsat/.

GPSL2003 will be held on the Boulder campus of the University of Colorado from 10AM to 5PM on Friday, June 13th. Numerous presentations and discussions will be lead by experienced Amateur Radio high altitude balloonists. (Contact EOSS President Mike Manes, W5VSI manes@... with additional topics.) A dinner will be held afterwards at a nearby eatery. More details and updates will be available at http://gpsl.eoss.org/ including a special accommodation rate at Ramada Inn Boulder.

Early Saturday morning, June 14th, GPSL crews will head east on I-70 to the town of Deer Trail, Colorado where they will prepare to launch at least three balloons carrying small BalloonSat experiment packages built by workshop attendees from NASA Space Grant Colleges and Universities all over the U.S. GPSL balloon teams will then conduct tracking and recovery operations using APRS and DF tracking beacons. (If weather on Saturday is unsuitable, launch, tracking and recovery will be postponed to Sunday morning, June 15th.)

All interested Amateur Radio and high altitude ballooning enthusiasts are warmly invited to attend this exciting event. Check http://gpsl.eoss.org/ for the latest GPSL2003 information.

Mike,

The group from N. Texas was Jerome and Bobette Doerrie, K5IS
and N5IS.
They are from Booker, which is a hop skip and jump from the
OK border in the NE corner of the TX panhandle.
Bet they would be real interested in attending.
Looks like Jerome's e-mail address is k5is@...

but don't have contact info for the N. Tx crew. Do you?
And no
word from Bill Brown, but he may pop up in response to
Ralph's
excellent and wide-spread email announcement. Thanks,
Ralph!

FOr Ralph: since no one's yet expressed a preference from
your
copious menu of presentations, then why don't you pick the
one
you most enjoy presenting? After all, we do this for
recreation,
don't we?

Hi Mike and all,

I am planning on attending the symposium and launch....I can give a 30 minute talk on various topics....early days of ballooning, night flights searching for meteor dust, rockooning, etc.

73s de Bill WB8ELK

Hi Bill,

Well, that's excellent news! What would a GPSL be without the grandaddy of ham radio ballooning? (in the US, anyway :=}. Re a presentation topic, why don't you pick something that you really enjoy presenting, and we'll put you on the agenda for whatever time you'd like.

402. GPSL 2003?

Yahoo group: GPSL (2002 — 2008)
Date: 2003-04-18 04:19:58 UTC
From: Michael L. Bogard
Topic: 402 Message: 402

Just thought I would let the group know that the BYBG/KD0FW group will not be able to attend the 2003 GPSL this year in Colorado. There might be a chance to have a 2003 GPSL EAST launch in Omaha, or the Kansas City area. We will just have to play that one by ear for now.

403. GPSL East?

Topic: 403 Message: 403

Is there an interest in launching balloons in the Kansas/Nebraska area after GPSL? I'll be visiting my parents during the 4th of July holidays. Perhaps a second GPSL can be arranged for this time.

If you'd like to come to Omaha for a day or two, we can fly from here on Friday, Saturday, or Sunday. I'm not sure if I can head to Kansas at that time or not - that will be less than three weeks before the baby is due. Both of my launch sites are completely outdoors, so we wouldn't be as protected from the wind.

We can arrange helium transport for whoever shows up. $70 per T-tank (plus a rental charge if they have one).

- Mark

Zack, can you make it up to Nebraska just after the 4th of July?
How about during a weekday?

I suppose I could stop in Nebraska on my way to Kansas for a
flight (and not just after visiting Kansas). Mark, what I would like to
do is bring a capsule to fly and just tether it to yours. I'll split the
cost of helium and the balloon. Perhaps we ought to try for an
altitude record.

I'm not sure what my schedule is going to be for this summer. My wife is a teacher and doesn't yet know if she's going to get a contract to teach next fall. She may be starting a new job this summer and that would pretty well limit much of our summer travels.

It may be more of a possibility to meet somewhere in eastern Kansas - I have an uncle in the KC area that we could stay with if we were to launch from that area.

416. CU SGC Workshop / GPSL 2003 Flight 14 June

Yahoo group: GPSL (2002 — 2008)
Date: 2003-05-15 02:37:09 UTC
From: Mike Manes
Topic: 416 Message: 416

Hi Bill,

Chris Koehler may already have told you that EOSS will be the "prime contractor" for the Workshop balloon flight on Sat 14 June from Deer Trail. As with last year's Workshop, EOSS will arrange for launch site access and will handle all FAA prelaunch notices and enroute position reports. In addition, EOSS plans on delivering both the Helium and enough 1200 gm Kaymont or Kaysam latex balloons to the launch site for all the flights. So all you need to bring is your APRS tracking beacon, parachute, flight string, fill rig and mobile tracking & recovery rig. CU SGC has agreed to pay for the balloons and gas used to carry the Workshop balloonsats.

This year, EOSS is also sponsoring the Great Plains Super Launch, an annual event initiated 2 years ago by Paul Verhage, which is an annual convocation of several amateur balloon groups in the US. Last year, six groups launched their balloons simulataneously from an airport near Manhattan KS and effected recovery of all payloads. Quite a spectacle!

GPSL 2003 is being held in the Denver area and in conjuction with the CU SGC BalloonSat Workshop. GPSL attendees from Arizona Near Space Research (ANSR) and Treasure Valley (ID) Near Space Project (TVNSP) have agreed to join you and EOSS in providing launch, tracking and recovery support for the 4 (or 5) balloon payload strings to be launched that morning. All of these strings will carry no more than 12 lb of payload weight in order to stay FAR 101.1(a)(4) exempt. For this purpose, payload weight includes everything except the parachute, balloon and commandable cutdown devices.

Now in order to arrange for FAA forecasting/enroute reports and for payload string weight planning, I will need to know some details about your 'chute and tracking beacon(s), which is presumed be GPS driven and downlinks APRS-compatible 1200-baud UI packets on 2m or 70cm:

1. Parachute diameter or MSL terminal descent rate w/ 12# load.
2. Beacon weight in flight configuration. (this deducts from the allowable balloonsat load)
3. Beacon callsign and SSID (-11 preferred).
4. Which bands / freqs can you downlink on?
5. Can your beacon transmissions be time-slotted to a particular second after the top of each GPS minute? (Provides for freq sharing w/ other beacons).

For ANSR and TVNSP: <<I need the same info from you as well!>>

If all balloons are filled for the same excess gross lift, launch simultaneously and are similarly loaded, then it is reasonable that they will ascend above FL600 close enough together to allow all of them to be reported to the FAA as a single "formation" flight - a far simpler process than separate reports. It is probably optimistic to expect that all will burst and descend as a formation, but by that time, they should be well outside DIA's approach and departure corridors, so position reports need not be a frequent.

There will also be a GPSL conference held on Friday the 13th at CU, courtesy Chris Koehler. This does conflict with the Workshop sessions, but if some of your team wishes to meet the GPSL attendees, including Bill Brown and Ralph Wallio et al, they will be warmly welcomed!

You are strongly encouraged to join the GPSL yahoogroups email reflector to stay abreast of developing details which may affect your flight operations on the 14th. There is a direct link to joining GPSL@yahoogroups.com right on the EOSS web site:

www.eoss.org.

There's also a GPSL web page there that covers the whole conference.

I look forward to your earliest convenient response, and don't hesistate to pose any questions that may pop up.

I'm trying for two launches and I think they will be close to identical

Descent around 1200 f/m (assuming the cutdowns are attached
above the parachute this time, and not below them).

I think I can keep the weights to 9 lb.

Callsigns will be KD4STH-9,10,11 (I'll have one 440 beacon for fox
hunting).

I'll stick with 144.390 for APRS. The 440 beacon I have yet to
select.

I can time slot.

Paul "Is the semester really this close to ending?" Verhage

> >
> > For ANSR and TVNSP: <<I need the same info from you as well!>>
>

Here is ANSR's information:

1. 1400'/min descent at 5000' MSL with "heavy" 12 pound load

2. Cross Band Repeater (3 pounds), Redundant Beacon (1 pound),
cutdown/antennas (0.5 pounds), 7.5 pounds for payload

3. KD7LMO-11

4. APRS on 445.950 MHz

Cross Band Repeater uplink 145.560MHz / PL 162.2
downlink 445.525 MHz

5. 445.950 MHz time slotted as follows in GPS seconds:

00, 30 Micro Beacon

10, 20, 40, 50 Cross Band repater when repeater not keyed up

15, 45 Landing prediction based on in-flight wind data collection
(After burst. SSID set to -0)

Lots of packets, but tracking and recovery likes to know where
everything is.

The cross band repeater is open for anyone to use for tracking and
recovery or general contact. It can also be set to link with the EOSS
cross band repeater in flight. So we will finally get our EBBE link.

73s de Michael Gray, ANSR, KD7LMO

419. Re: Hi from WB8ELK

Hi Bill,

Great to hear from you, and thanks for talking up GPSL! BTW, some of the EOSS trackers will be at Dayton as well: Benji W0CBH, Ben KB0UBZ, Larry N0NDM, Ann KA0ZFI and Chris KB0YRZ. Say hi (.... ..) to 'em if you cross paths.

Quickie info: GPSL conference will be held Fri 13 June in the Eng'g Bld'g on the Colo Univ campus in Boulder, CO. Dinner venues for Thur and Fri PM have been arranged.

The flights will go from the HS field at the SE end of Deer Trail CO, about 50 mi E of Denver on I-70, on Sat 14 June at 0900 -- we'll be setting up there at 0700 MDST.

Details & directions are at: gpsl.eoss.org.

These flights will be carrying up small "balloonsat" payloads prepared by NASA Space Grant College attendees at the concurrent Workshop sponsored by Colo Space Grant College at CU. At least four separate balloons will be launched, tracked and recovered by GPSL teams: EOSS, ANSR and TVNSP, also joined by the MT State SGC balloon team.

See: spacegrant.colorado.edu\studentsat

Thanks for your support, and I look forward to seeing you in Boulder!

BTW, consider joining the GPSL yahoogroups email reflector to get the latest/greatest dope on what we're doing.

Rick,

Here is my alleged plan. A discussion of -Packet Radio Bit Error Rate- will lead us to -Radio Link Budget Analysis using Excel- and, finally (you say) to -Communications Footprint Predictions using Radio Mobile Deluxe-. I could talk for well over a hour on all three of these topics but will restrain myself to time provided.

If we are sitting around late Friday afternoon with time to kill, I can discuss a few aspects of Solar Floater. Regardless I will bring part of it for show-and-tell.

Hi Mike,
VHS playback and video display (usually projection) have been in
every classroom I've worked in at CU Eng'g. Not sure about DVD
or S-video. I'll wait for Chris's response re Ralph's query
re SVGA interface.

BTW Mike, Jack said he thought your flight computer payload could
downlink APRS beacons as KD7LMO-11 on 445.975 MHz, time slotted at
10 sec after the top of each GPS minute. 'Zat so?

For Paul: Still need the TVNSP APRS beacon capabilities re time
slotting, carrier detect, callsign, freqs.

Topic: 424 Message: 428

Thanks for the info on the AV equipment. I'll be sure to bring a VHS tape as well.

Here is the information on the equipment we will bring.

Should we bring our own Lithium batteries or will you have some available? I need 1 (one) for the Beacon and 3 (three) for the cross band repeater. If we need to bring them, I'll have to ship them via UPS ground ahead of time. The airlines won't let you fly with them and I'm not going to take a chance if one of them decided to "vent" during the flight.

1. 1400'/min descent at 5000' MSL with "heavy" 12 pound load

2. Cross Band Repeater (3 pounds), Redundant Beacon (1 pound), cutdown/antennas (0.5 pounds), 7.5 pounds for student payload

3. KD7LMO-11

4. APRS on 445.950 MHz

Cross Band Repeater uplink 145.560MHz / PL 162.2
downlink 445.525 MHz

5. 445.950 MHz time slotted as follows in GPS seconds:

00, 30 Micro Beacon

10, 20, 40, 50 Cross Band repater when repeater not keyed up

15, 45 Landing prediction based on in-flight wind data collection (After burst. SSID set to -0)

Lots of packets, but tracking and recovery likes to know where everything is.

The cross band repeater is open for anyone to use for tracking and recovery or general contact. It can also be set to link with the EOSS cross band repeater in flight. So we will finally get our EBBE link.

Hi Paul,

Thanks for the info. A few more questions:

1. Were you planning on flying all 3 beacons on your flight string? If so, then could you put the TT3 w/ plain text hhmmss and alt format on KPC-3 on 445.975 as KD4STH-11? Your time slot would be 20 sec after the GPS minute. We will have an I-gate station committed to the GPSL beacons on that freq.

2. How much do your beacons weigh, and which will you be flying? We want to reserve as much weight budget under the 12 lb limit for SpaceGrant balloonsats as possible.

3. If you wish, Jim K0JLZ has invited you to join him as navigator on the T&R crew. Jim has both APRS and doppler DF in his SUV.

4. Although 144.39 is a sure way to get yourself gated onto the I'net, that freq is terribly crowded out here near Denver -- you may have a hard time avoiding collisions. EOSS normally uses 144.34 or 147.555 for our 2m beacons. Our I-gate can also gate beacons from one of those freqs.

Oh, one other question: I'm scheduling the speakers for the GPSL conference Fri 13 Jun, and recall that you have a presentation to give. You'd be joined by Bill Brown, Ralph Wallio, Mike Grey and myself (+ perhaps 1 more EOSS presentation). Do you have a preferred time? The program schedule is shaping up as:

Thurs 12 June
1900 - Group dinner for early arrival at Souper Salad, Boulder

Fri 13 June
0900 - Open room, set up displays and greet attendees
1000 - 1st speaker
1100 - 2nd spkr
1200 - Lunch (I'm looking into on-site catering)
1300 - 3rd spkr
1400 - 4th spkr
1500 - Final plans, forecasts Q&A for GPSL flight Sat 14th.
1600 - Adjourn
1700 - GPSL Banquet at Turley's Restaurant
1900 - EOSS preflight net on 147.225 / 145.46 rptr (107.3 PL)
this is 1 hr earlier than normal due to 1.5 hr AM drive

Sat 14 Jun
0530 - Depart Boulder for Deer Trail (I-70 50 mi E of Denver)
0700 - Arrive Deer Trail High School launch site
0900 - Launch 4-5 ballons w/ balloonsats
1115 - Tally-hos begin.
1300(?) - Meet at Marty's favorite greasy spoon (TBD depending on landing sites) for lunch and recap.

Hi Paul,

I found a lot of Geographics in the garage and barn, but couldn't find the early sixties, sad to say.

Hope you find another source.

- Bill WB8ELK

BTW, I gave a talk about GPSL2002 at the Dayton Hamvention ATV forum and also at the ATV dinner on Friday night.....everyone loved the Mr. Potato Head in Jail photos. I gave out info on GPSL2003 so hopefully some folks will be interested.

From: Mike Manes
Topic: 424 Message: 432

Hi Mike,

I failed to mention payload flight line to support up to 8 balloonsats. They're fitted with vertical thru tubes to pass at least a 3/32" OD line (we use Technical Textiles dacron for this), and will be spaced at spaced about every 12" down the line and separated by a half-hitch on a bight. EOSS can supply this if you can't. You will need a bowline at the bottom of your flight line to tie the balloonsat string to, however.

OK on the 4 @ Li D-cells. I assume that you use the 1.32" OD x 2.3" H cells from surplus BA-5513/U packs? Trade ya for a dc-dc converter?

Re the APRS downlink freqs: EOSS has taken the responsibility for notifying the FAA (Denver Center and DIA Tracon) of what could be up to five separate balloon positions in flight. This is part of long-standing agreement that allows us to operate in one of heaviest-trafficked air corridors in the US. During the past 3 EOSS flights, the local FAA controllers have taken a strong liking to the 60-sec VOR and altitude updates provided via www.wxqa.com, and they will expect the same during GPSL.

445.975 MHz has been designated as the time-slotted APRS downlink freq for what could be up to five separate balloon tracking beacons. This freq has been shown to be free of QRM in the Denver area, and it's the one that our Igate stations will be tuned to on 70 cm. So in order to accomodate 60-sec APRS updates from five separate beacons, we will have to time slot at :00, :10, :20, :30 and :40 after the GPS minute. So as you can see, this freq can't support much more than just those beacons, and certainly not 8 slots from just one balloon. At least some of these beacons are "deaf", so conventional CD collision avoidance will not be operative.

I'd propose that you put your micro-beacon, time slotted at 0:10 on 445.975, and your flight computer downlink on a separate freq -- say 446.025. This will provide your rapid-update and still leave room for your cross-band repeater downlink on 445.525.

In the interest of conserving weight, and in view of the fact that the EOSS crossband uplink is rockbound on 445.975 (which is how we know it's a clear freq!), I don't plan on flying that module during GPSL. I do plan on flying the EOSS APRS module and APRSLite (2.3 & 1.7 lb) on the EOSS string; the 445.975 bcn will be slotted at 0:00, and the other will be on 144.34. This leaves 8.0 lb for balloonsats. Weight budget permitting, I'll add the 1.1 lb DF/cutter on 145.600.

For Bill Hiscock: still need your beacon and 'chute properties and
weights.

For Paul Verhage: can your beacon operate on 445.975? And I need your
beacon weight(s) and 'chute properties.

Hi Ralph,

Sorry to hear about the scotched plans to visit old friends out
thisaway.
But thanks for hanging in for GPSL! I know there are folks who will
enjoy meeting you for the first time.

I've not yet got my head around where I'll spend Fri nite. My QTH
is a bit closer to Deer Trail than Boulder is, and I'll need to get
the >>ElectroVan<< fully loaded as well. So may not even be able to
make the Fri PM Banquet. I might even consider getting a room in
Byers (10 mi W of Deer Trail) that night to get on site for setup
at 0600. But I'm sure that you'll find transport, either with GPSL
folks or a van from the Ramada. I'll check the latter availability.

Hi Bill,

Thanks for pitching GPSL at Dayton - guess we'll find out if there were any takers, eh? And I have you slotted for 1 hr at GPSL - hope that'll be enough time. We have 4 1 hr slots - 2 AM and 2 after lunch. Any preference?

There's been a lot of chatter and pondering about going to WBFM ATV on 1.2 or 2.4 GHz lately. I think WBFM would present a less severe QRM problem for other stuff on the payload string (the KPA-5 wiped out GPS lock on the EOSS-66 / UK Big Blue glider). And I think I might be able to get better than 50% dc->rf power conversion on 1.2 GHz using a modulated PP power osc. Your thoughts would be welcome.

It can. Both of my stacks will weigh around 9-10 pounds each.
That includes beacon.

My chutes will descend at around 1000-1200 feet per minute. I'm
using a 5' diameter chute on one stack and a new 7' chute on the
second.

Hi all,

I'm hoping to fly June 14th from the Omaha area, at the same time the large group is flying in Colorado. Will anyone out there be sending packet data on 2 meters? Perhaps one of the payloads could transmit via NSTAR and we'd see if we could get it digipeated this way. It wouldn't be a 2-way path, but at least we'd get BBE out of the deal.

Also, if someone were doing crossband voice to 70cm out, we could put our simplex repeater on the output and maybe pick that up too.

Hi Bill,

The "400 lb gorilla" in my 70cm ATV package is 0.6 lb of Li batts
to run it for 3 hrs. That 1W out/6W in (16%) power conversion
effiency gags me. I've seen power oscillators do better than 90%
at 1 MHz, and CU has developed ~80% 2.5 GHz RF sources for the old
microwave satellite solar power idea (shades of N. Tesla!). I figger
it's simple to FM a "semi-disciplined" uW power osc and run the whole
rig for a flight using one 85 gm 4 A-hr Li cell.

You have the 1300 slot on Friday. Thanks!

Thanks Chris,

For Ralph: It looks like a under a one mile hike to the GPSL site, but I suspect that rides will be available if you need one. The big kink is pricey and rare on-campus parking.

For Bernadette Garcia: What do you show for box lunches @ about $5 per person delivered to the Eng'g bldg on Fri 13 June? How about AM coffee / juice & bagels / donuts?

For GPSL attendees: any dietary preferences or restrictions for lunch?

Hi Chris,

I assume the laptop also has uSoft PowerPoint loaded? If not, then
I can bring one that does, but not sure how to interface to your
projector -- safe to assume it has a SVGA cable supplied?

And I'll bring along the EOSS VCR and RCA cables for tapes.

Have you got a final meeting room for the GPSL conference assigned?
If so, could you provide directions / map?

BTW, http://gpsl.eoss.org has Rick's fine stuff on the GSPL event/

Hi Paul,

Yup! CU has some NASA Spacegrant budget to supply the GPSL teams
that can carry at least >7 lb< of >recovered< balloonsats with 1200 gm
latex bags and the He to fill 'em for ~ 1000 fpm for 12 lb.
They'll be supplied gratis by EOSS at the launch site.

So you should keep hacking away at your stacks to get 'em down to <5 lb,
including any backup beacons. Note that the EOSS team can do DFing
on a any backup beacon on 2m having at least 300 mW ERP (DJ-C1).
I've come up with a corrolary to K.I.S.S for ballooning: K.I.L.L:
"Keep It Light, Larry!", w/ apologies to Larry "Lawnchair" Walters,
may his soul Rest in Peace.... (or was that "Lunkhead"? ...)

The balloonsats use Onset Hobos to log data, so they don't use or need
downlinks. So provide yer own RF. But that makes recovery a must!

How much assistance will you need to fill two ballons in time for
a mass launch at 0900? EOSS is having to grub a bit for balloon prep
crews. Maybe you could bend a few TVNSP arms to join you? More the
merrier.

Which KD4STH SSIS's will you be using? We need these to get 'em set
up for the FAA VOR reports on wxqa.com.

Hi Paul,

If you and whomever TVNSP comes along can track and recover >three<
balloons, then go for it. But CU and EOSS have agreed to support
only a max of five balloons for GPSL & the CU Workshop. To date,
those will be EOSS(1), ANSR(1), Mt St(1) and TVNSP (2). K.I.L.L!
The 6th balloon and gas are held in reserve for launch contingency
only.

I'm trying to get a few TVNSPers out this way. Dr. Hiscock and
the Montana Boys will help me with the filling and launching.

> Which KD4STH SSIS's will you be using? We need these to get 'em set

I'll use KD4STH-11 and 9.

I'll work on the weight and get it down to 5 pounds each.

There is now a possiblity that HABITAT SkyLab may launch locally during GPSL 2003 in June.

There is also the possiblity we could in July (and/or ?), again locally.

From: Mike Manes
Topic: 416 Message: 447

Hi Bill,

My apologies for any unintended snub regarding the title of the workshop -- I think I generally refer to it as the CU SGG BalloonSat Workshop, at least when introducing the event.

And as you may have learned, the 2003 Great Plains Super Launch (GPSL) is being hosted by EOSS this year and will be held inconjunction with the Workshop. GPSL attendees will be meeting all day Fri 13 June at CU, courtesy Chris Koehler. We plan to meet for dinner at the Souper Salad Thursday evening, any you and Chris are more than welcome to join us - I think we can work out any last minute hitches then. And you or another of the Mt State team is welcome to the GPSL conference as well. See http://gpsl.eoss.org for all the details.

Regarding the APRS beaconing: EOSS has committed to provide FAA Denver Center and DIA Tracon controllers with enroute position reports as per last year. But since that time, some of our group have developed a web-based APRS reporting system using findu.com processes. This scheme provides FAA controllers with VOR radial and range with altitude reports with 60-sec updates. We've used it on the last 3 EOSS flights, and the FAA have taken a strong liking to it. And it saves us a bunch of cell phome roaming fees as well. This system relies entirely upon certain cooperating Denver-area ham stations to serve as gateways (Igates) from the 70cm and 2m APRS beacon downlinks and into the internet. So far, our Igates can receive only one 70cm freq and one 2m freq at a time.

Since last year, the FAA has become pretty antsy about balloons intruding on DIA approach and departure corridors -- we're launching just 35 NM from DIA. So even though all of the Workshop flights are FAR-101 exempt, EOSS has a policy of letting the FAA know where we are so they can keep their aeroplanes away from our valuable payload strings :=}.

Thus for this flight of five balloons, we are compelled to do some frequency reuse by means of time-slotting, i.e, allocating each balloon its own 10-sec segment of each GPS UTC minute in which it can xmit its APRS beacon without stepping on another. For that purpose, EOSS has picked 445.975 MHz and 144.340 MHz, both of which have been proven to be QRM-free during past flights. The 144.39 MHz APRS backbone would eventually get you gated into the internet, provided you include IGATE in you path; but that freq is extremely busy in the Denver area, even for terrestrial stations. We tried it once during a flight, and our KPC-3's mind got blown ascending above 40K' and it stopped generating position reports. And any APRS

beacon hitting on 144.39 every 11 sec is sure to create consternation amongst the Front Range APRS community.

In the event of an APRS failure, EOSS is prepared to manually track the balloons and make cell phone reports.

Now, you are not the only balloon team that would like to downlink more frequent reports. EOSS would like to as well. So what we have done in those cases is to carry two APRS beacons on each balloon. One operates on one of the shared freqs with 60-sec time slotted time, lat/lon and altitude, while the busier downlink goes on a separate freq. And it's not a bad idea to carry up a spare beacon - it's saved EOSS's bacon many times in the past!

An easy, albeit costly, backup beacon can be built using a Kenwood D-7 HT plus any GPS receiver that has NMEA $GPGGA serial output. Or the cheap route is to get a Dyoincs TinyTrak 3 and a cheap HT (Alinco DJ-C5 dual-bander is flight proven), plus the GPS; this does require more sweat equity, however. Either one can yield a flight-ready package that weighs under 1.7 lb with antenna and 48-hrs of battery.

If neither of these alternatives is acceptable, then I'd propose that you do you own thing and accept the responsibility for making you own FAA reports. At launch and up thru FL230, call DIA Tracon Ops at 303-342-1590; above that up thru FL600, call Denver Center Military Desk at 303-651-4252. Let them know your cell phone number. Reverse that process during descent, and call 'em both when you've landed. These reports should include your flight ID (EOSS-67C, which will have been filed on our HiBal Notice), altitude, time and VOR position (3-letter VOR ID, mag radial and NM range) For this flight, suggest you use the Falcon (FQF) VOR. The controller will advise you at which altitude to make your next report. (They normally ask for FL230, 350, 450 and 600 in ascent and dscent, but if we're close to DIA, they may want more frequent reports). These reports should be no more than 3 minutes old when you call 'em in.

For Merle K0YUK: can you let Bill know what fill tube diameter to use with a 1200 gm Kaysam?

Hi Paul,

Let Bill know which fill tube diameter needed for a 1200 gm Kaysam,
in case Merle missed my earlier embedded request replying to Bill's
email.

Thanks for getting the weight down! Assuming the worst-case (700 gm)
balloonsat weight, here's the 'sat allocation per flight string:

EOSS (EOSS-67A): 8.0 lb, 5 sats
ANSR (EOSS-67B): 7.5 lb, 4 sats
Mt State (EOSS-67C): 8.0 lb, 5 sats
TVNSP-A (EOSS-67D): 7.0 lb, 4 sats
TVNSP-B (EOSS-67E): 7.0 lb, 4 sats.
Total: 37.5 lb, 22 @ 700 gm sats.
(The EOSS-67 stuff is for FAA "side number" reporting purposes only)

This may be just right, depending on the number of teams attending
the SGC Workshop. If the 'sats come in at 500 gm, then the 37.5 lb
limit will go a whole lot farther.

Hi Mike,

OK -- yer on at 1000 - 1100 on Friday the 13th (I didn't schedule this date!) We have five one-hour slots scheduled, and all are full. BTW, Bill Brown is one of the speakers. I'm getting behind on passing the word to alcon - too many arns inna farh! If you want to show your DVD during the 0900 - 1000 reception, that would be great as well.

Attendees are all experienced balloonists, so "fundamentals" may not draw too much interest. But new stuff, like ANSR's liason with AZ Space Grant, sure would. That and the prospect of national IRPL balloon net -- and yer on-board BallTrack algorithm. etc. OF course, historical perspectives pre-helium :=} are neat as well.

Hi Bill,

I know what a pain it is having to share the spectrum and stratosphere
with all these other folks. It's like herding cats from this end!
But unless we all wanna carry up FAA Mode-3 transponders (7lb + batts,
1 KW PEP pulse emissions at 1 GHz + kilobucks ....), this is the only
reasonable alternative I can come up with.

The Kenwood D7 can be configured for time-slotting - a number of other
groups use 'em as well. Only thing I don't like is that >B0-o-O-gus<
Mic-key cryptic APRS format! Fortunately, findu.com and wxqa.com
capiche Mic-key.

Recommend you or one of yer team spend an hour with the D7 manual and
a glass of vintage Chateau Bayonne to discover the secrets ensconced in
Japlish :=}. Altho a secondary beacon would be desirable, it does
deduct from the balloonsat payload budget; I think Mark Caviezel of
ES-OS may have one for loan - he's on this reflector.

Let me know how you fare, and have a good Memorial Day.

I use a 1.25" PVC pipe, which I believe is 1.5" OD.

> Thanks for getting the weight down! Assuming the worst-case (700 gm)

Not a problem. I didn't realize we were carrying payload.

> EOSS (EOSS-67A): 8.0 lb, 5 sats

> (The EOSS-67 stuff is for FAA "side number" reporting purposes only)

For TVNSP, this will be flight TV03E1 and TV03E2 (not that it's
important).

I think it's great. We were lucky with GPSL 2002. Let's see if we
can make GPSL 2004 even bigger.

NWSL will have two balloons and is scheduled for next Saturday.

Bill, TVNSP may be able to provide a tracker. Do you have a GPS?

457. Re: [KNSP] NSTAR 03-C - June 14th?

Yahoo group: GPSL (2002 — 2008)
Date: 2003-05-27 07:27:03 UTC
From: Mike Manes
Topic: 457 Message: 457

Hi Don,

ANSR plans on flying its crossband repeater during GPSL on 14 Jun.
Launch is set for 0900 MDST from Deer Trail CO, 50 mi E of Denver.

According to Mike KD7LMO:
Cross Band Repeater uplink 145.560MHz / PL 162.2, downlink 445.525 MHz.

The rest of the balloons will be beaconing APRS on 445.975 and
144.34 MHz with -11 SSIDs.

Hi Mark,

According to Mike KD7LMO:
Cross Band Repeater uplink 145.560MHz / PL 162.2, downlink 445.525 MHz.

The rest of the balloons will be beaconing APRS on 445.975 and
144.34 MHz with -11 SSIDs.

Hi Chris,

Thanks! This is shaping up to be quite an event! Hope I can keep
all the plates in the air in the meantime.

Do you have any better idea of how many Balloonsats we should expect
and how much they will weigh?

Not sure about the other GPSL attendees, but I think I may be busy
cutting ZZZZs Saturday evening. However, I expect that lunch on
Saturday will be at a suitable eastern CO greasy spoon near the
recovery site; I think you're familiar with that process :=}.

Is there any special provision required to connect a laptop to the
projection monitor in the Eaton Conf Rm?

460. Counting balloons

Yahoo group: GPSL (2002 — 2008)
Date: 2003-05-28 13:19:26 UTC
From: Ralph Wallio, W0RPK
Topic: 460 Message: 460

A suggestion folks.

If Mark/NSTAR and/or others are going to coordinate flights with GPSL for purposes of EBBE, et al., then we could consider including them in the GPSL2003 balloon count.

Another balloon for the count:

From the ES-OS e-mail list:

Gang:
heyyyyyyyyyyy, wow have been doing a ton of
non-balloon related stuff in recent times.
Anyway, a plan has been hatched....
126,000 cubic foot balloon to be built and flown at
GPSL on June 14 2003 out of Deer Trail, CO. It
should take 10 lbs payload to 120k feet.
Stay tuned here for updates and official flight
announcement. As usual, interested volunteers are
welcome to help preflight/day of flight.

Hi Chris,

Thanks for paring the weight down. Depending on how the pieces tote
up per flight string, it looks like we can carry upwards of 28 @ 600 gm
balloonsats. How's the Workshop team count looking so far?

OK on the video projector. My laptop does have an external SVGA jack,
but I don't have a cable.

Hope to see you at the HamCon in Estes Park this Saturday.

I found out today, I do start the training class Monday.

It is yet unknown if we can have a balloon ready by the 14th but I don't see why not. We will work with that aim in mind. I'll check with the group and see who/what is available.

I'll keep you posted. It may be next weekend (first weekend in June) before I know for sure.

464. NSTAR 03-C flight announcement

Yahoo group: GPSL (2002 — 2008)
Date: 2003-05-31 03:29:32 UTC
From: Mark Conner
Topic: 464 Message: 464

Nebraska Stratospheric Amateur Radio (NSTAR) Flight 03-C is scheduled for Saturday, June 14th from our usual launch site near Treynor, Iowa. This flight will be about the same time as the multi-balloon Great Plains Super Launch being held in Colorado that morning. I have a 1200g balloon which should get us to just under 100,000 ft.

Launch time is still TBD. The Colorado balloons are scheduled to fly at 1500 UTC, which is 1000 CDT. We may not be able to wait that late in the morning. One possibility is to be ready for a 0800 CDT (1300 UTC) launch, then hold if the winds permit. I don't think we can launch earlier than 1400 UTC and have a decent shot at having mutual visibility between NSTAR and the GPSL balloons.

Primary APRS will be on 144.340 with callsign N9XTN-11 and a digipeater alias of NSTAR. Backup APRS will be on the national 144.390 frequency with callsign N9XTN-12. Simplex repeater will be on 446.300 MHz. The camcorder and still camera will also fly.

As launch approaches, day-to-day updates are posted to the KNSP list at http://groups.yahoo.com/group/KNSP . Also see the NSTAR web site at http://www.nstar.org for more information.

471. Long-range forecast for June 14th

Yahoo group: GPSL (2002 — 2008)
Date: 2003-06-03 14:43:21 UTC
From: n9xtn@cox.net
Topic: 471 Message: 471

At this point, it looks pretty decent for launches in both the Omaha and Boulder areas. Some showers are possible along the Front Range, but I think they'll be mostly in the afternoon. No major surface or upper-air systems are forecast to pass through either area, and about 30-40 mile chases to the east can be expected.

In the Omaha area, we may have a setup where stronger surface winds will start later in the morning. If so, NSTAR may have to launch too far ahead of the GPSL flights to get good mutual visibility for digipeating between balloons.

Temps look to be above normal in Colorado, near or below normal in Omaha.

Hi Bernadette,

Thanks for the tips. I'm copying this to the GPSL attendees and
seek input on their preferences.

The Blackjack Pizza deal looks pretty good at the outset; please do
send me the ordering details.

For the GPSL group: should we consider bringing in some AM snackies?
This would involve a jelly-jar payment scheme, o'course.

Thanks, Mike

476. GPSL attendance scrubbed

Yahoo group: GPSL (2002 — 2008)
Date: 2003-06-05 10:14:11 UTC
From: Ralph Wallio, W0RPK
Topic: 476 Message: 476

Mike and everyone attending GPSL2003,

The conflict that scrubbed our family vacation in conjunction with attending GPSL2003 has now made it unreasonable for me to be with you folks next week. Sharon has a huge project underway requiring long days and long weeks at work with staff and consultants. Yesterday she made plans that call for a peak in work load late next week. This is all very tiring so I need to be here to make sure she doesn't have to worry about anything but project demands.

I apologize for creating a hole in your speaker schedule. My PowerPoint presentation is complete save for small changes every time I go through it. If you do not have better use for the time, I would be happy to add audio remarks to the file and send a CD that can be played in my absence. The discussion starts with packet radio bit error rate, moves on to link budget analysis and ends with footprint predictions.

All of this can be reviewed in my web pages,
http://users.crosspaths.net/~wallio/ber.html then
http://users.crosspaths.net/~wallio/LINKbudg.html and finally
http://users.crosspaths.net/wallio/Radio%20Mobile.html. I will share my EXCEL and Radio Mobile files with anyone interested in learning more.

I will forward your Friday banquet head count request to John Nordlie at UND and ask him to respond directly to you.

Regards to all,

TNX es 73 de Ralph Wallio, W0RPK

Hi Ralph and John,

Doggone! Sorry you were forced to change plans. Be assured that you will be sorely missed! I know that a bunch of folks were looking forward to meeting you.

We'd still like to see the product of all the work you've put in to your presentation on packet radio range, however, so if it's not too much trouble, please shoot me a CD to:

Mike Manes W5VSI
6002 W. Alder Ave
Littleton CO 80128-6037
Tel 303-979-4899

For John: Glad to have you and your students come aboard. Hope you find out what ticks with all these balloontics! BTW, you may know GPSL is being held in conjuction with the NASA Space Grant BalloonSat Workshop being hosted by CU. From what I can find, U. ND has not yet attended this forum, but you might wish to touch base with a fellow from SD Mines who will be here this year:

Larry Stetler, SD School of Mines & Technology

The flight predictions for Saturday, June 14, 2003 are now being posted.

I'm posting for the EOSS payload configuration but these predictions
should be ok as a guide for all balloon flights on that day. Naturally,
each group will want to tailor the flight parameters for their systems.

481. Long-range forecast for 14th

Yahoo group: GPSL (2002 — 2008)
Date: 2003-06-06 20:33:16 UTC
From: n9xtn@cox.net
Topic: 481 Message: 481

The forecast for next weekend isn't quite as nice as it looked earlier in the week. The last three runs of the GFS model indicate unsettled weather through the central US from Thursday to Sunday. A series of weak disturbances will cross from California to the Ohio River valley triggering occasional showers and thunderstorms through the period.

Saying we will or won't have rain Saturday morning is a tough call eight days out, but the chances are greater than normal. The showers should be isolated, so it may be possible to wait it out that morning. Sunday doesn't look any better or worse.

With such a weak pattern, the winds at the surface and aloft should be light when outside the influence of nearby storms. Eyeballing this morning's GFS soundings for both sites shows short chases for both groups.

Hi Chris,

Great! I have a 10/100BaseT NIC with RJ-45 on my laptop. This will
also be very handy for getting the latest trajectory forecast for
Saturday.

Is there any trick required to access your network i'net port?

BTW, what's the latest re balloonsat count? I assume we're still
looking at 600 gm each?

And have you got directions to the GPSL meeting room yet?

Best regards, Mike

483. EOSS attendees for GPSL Conference, Fri 13 June?

Yahoo group: GPSL (2002 — 2008)
Date: 2003-06-07 01:15:05 UTC
From: Mike Manes
Topic: 483 Message: 483

Hi,

I need a pretty accurate count of how many EOSS folks intend to participate in the GPSL Conference in Boulder next Fri 6/13, 0900 - 1600. And I also need to know how many EOSSians plan to join us at the GPSL banquet at Turley's in Boulder at 5 PM that evening so I can make reservations.

So please let me know ASAP each of your plans re:
Conference?
Banquet?

You can get details on the EOSS web site, but in a nutshell, there's no charge for the conference, but on-campus parking will be hard to find, so pooling is recommended. And morning snacks, pizza lunch and the banquet will be at your own expense.

And don't forget that the T&R net for EOSS-67 will be held at >> 7 PM << rather than 8 that evening on the 147.225 machine. Launch of 6 ballons will be from Deer Trail at 0900 the next morning, Sat 6/14.

Hope to see you there!

Ok, it is official, we won't be able to participate next weekend. I hate to miss GPSL but it is unavoidable.

I will try to monitor as best I can. Is there going to be an EBBE attempt? I might be able to hit that while mobile.

Good fortune to those that fly! We will be thinking about all in participation.

For those of you who made reservations at the Ramada Inn at Boulder, that hotel has undergone a name change. It is now the Boulder Outlook Hotel and Suites. I meandered up there yesterday to check it out and discovered this change.

I photographed the Hotel from the most likely driving approach for your assistance in not seeing a familiar Ramada signpost. For more info see:

http://gpsl.eoss.org/accomodations.htm

NSTAR will have a digipeater on 144.34 with alias NSTAR. If any of the Colorado balloons flying a 144.34 MHz APRS payload would like to attempt a digipeat through us, let me know. This won't be a 2-way QSO record, but simply to see if data can be passed from one balloon to another over a distance of a few hundred miles.

We have a somewhat peculiar wind profile forecast for next Saturday. The NSTAR forecast track is to the northwest about 15 miles, which is OK for us but not by much.

Hi Mark,

I'll put the Big APRS as W5VSI-11/digi EOSS/node BALNOD on 144.34.
The EOSS launch site will be W5VSI-1, and if things go smoothly
after launch, I'll be available for a shot at EBBE.

That forecast is totally bad news for GPSL outta Deer Trail - puts
us right smack into DIA Class B airspace and possibly even inside
the airport perimeter! Hope our local winds don't do that to us!
We gotta go east, even just a bit, for this one.

For DOn: hope you can participate vicariouly. GL!

A thought to keep in mind for the group.....

If you take film photos at the GPSL, consider getting them put on CD when you do your photofinishing. Many Wal-Mart 1-hr photo-finishing shops will make a CD for you for about $3.50 per roll. This will facilitate sharing photos on-line after the flights, and beats an afternoon of flatbed scanning. I've been very pleased with this service from them - nearly as good as my film scanner.

492. FW: Inquiry as balloon drags girl to death

Yahoo group: GPSL (2002 — 2008)
Date: 2003-06-09 19:20:13 UTC
From: n9xtn@cox.net
Topic: 492 Message: 492

It appears a moored helium balloon was used to give people rides, then a storm kicked up and the mooring lines caught a young girl and dragged her away (I don't think she was riding at the time).

I don't think I'd ever tie myself to such a thing even on a perfectly quiet day. Can you imagine what would happen if the mooring lines came undone while you were attached?

73 de Mark N9XTN

http://news.bbc.co.uk/2/hi/europe/2974342.stm

Inquiry as balloon drags girl to death

An investigation is under way into a freak accident in which a five-year-old girl was swept 40 miles to her death by a helium balloon in Germany.
The British youngster became entangled in the mooring ropes of the balloon as it was taken by high winds.

It was about to be used for fun rides at a British military show at Rheindalen, near Moenchengladbach in western Germany.

The body of the girl, whose father is a British serviceman, was found near the balloon's wreckage two hours later.

British military spokeswoman Lieutenant Colonel Helen Wildman said the plan was to lift people up and down with the balloon tethered to a rope on a hot, sunny day.

She told BBC Radio 5 Live: "The weather was very nice but suddenly it changed and it became extremely stormy.

"The balloon broke away from the rope and flew away.

"Unfortunately, the rope got tangled with a five-year-old girl and dragged her away with the balloon.

"She was lifted in the air."

Colonel Wildman said the sudden storm with "huge hail stones" created havoc, with six people injured including one who needed hospital treatment.

"Furniture was being whipped into the air and hurled across the showground and brand new cars on show were damaged.

"Then we saw the balloon lift off and within minutes the rain had stopped and the sun came out again. It was utter chaos for a couple of minutes."

Family 'devastated'

A search was immediately launched by German authorities and British military police.

"They began by searching the immediate local area around the showground and were extending it further when they received a call from the police in Hamminkeln, near Wesel, to say that they had discovered the balloon and the body of a young girl."
The child's body was discovered approximately 100 metres from the balloon.

An investigation into the accident is under way.

"The investigation will look at a number of issues including whether the correct safety procedures were followed.

"Having said that the weather was so freakish that I'm not sure if anything could have prevented it, but that is for the investigation to say," Colonel Wildman said.

The girl's parents, who were with her at the show, are being cared for by family liaison officers and were said to be "devastated".

Her father is a serving British soldier and her mother is German, Colonel Wildman said.

The rest of the military show, which had only been open for an hour and was to continue until Monday, was cancelled.

493. Uncertain track forecasts for GPSL

Yahoo group: GPSL (2002 — 2008)
Date: 2003-06-09 21:21:04 UTC
From: n9xtn@cox.net
Topic: 493 Message: 493

The forecast situation for this weekend will make it tough for everyone to determine a proper launch site. At least two weak circulation centers over the Central Plains will cause light and variable winds, with the forecast track changing from one run to the next as the predicted location of these centers change (a small difference in the location changes the wind directions a lot). The chase should be short (15-20 miles) but the direction will vary a lot.

Reading some of the forecast discussions, it appears there is low confidence in the details of the models from about Thursday on. It is likely that a launch site will have to be selected at the last minute based on a Friday afternoon or evening forecast.

For NSTAR, I'm starting to look at alternate launch sites, as it's possible both my in-laws' farm west of Omaha and Scott Clark's place near Treynor may both be unsuitable. If the wind forecast is this uncertain, we may a launch site where we can fly 15-20 miles in any direction and be OK. Somewhere in the vicinity of Red Oak would be ideal - perhaps at a school or park in town.

Hi Bill,

Sorry you can't make it to GPSL in person - dang!

I'm clueless re Echolink, except to have played with it at another
ham's QTH. Do any of the GPSL attendees have the software to run on
my laptop, or your own over a 100BaseT NIC? If not, I think I can
"invoke" uSoft NetMeeting, 'tho I've never used it before -- any
local experts?

ANd Bill, my I'net here is dialup. I >think< Marty Griffin WA0GEH
(you met him at the '93 EOSS confernece and at GPSL '02 in KS) has
a hi-speed connection. He'd be the best shot for an upload -- lacking
that, Rick N0KKZ (also at both), who's our Webmeister and who has
a spearate dialup line.

My snailmail is:
6002 W. Alder Ave
Littleton CO 80128-6037
Tel 303-979-4899

I think that the best shot for an EBBE QSO will be on 144.34 packet
via balloon digis NSTAR and EOSS. The EOSS gound station will be
W5VSI-1.

Hi Paul,

I'll have mine at the launch site only: 303-885-5751. Might wanna get
Marty's if you need help in the field launch day. Do bring a radio
that can work the T&R 70 cm repeater.

Hi Mike,

If you go to the following website, you can download Echolink and I then can connect to you at the conference for a 2 way QSO for my talk, all you need is a microphone for your laptop....I'll also post my talk on my website in case the Power Point file has a problem. I'll have the powerpoint file uploaded by tomorrow night.

Echolink:
http://www.synergenics.com/el/

My talk:
http://www.wb8elk.com

73s de WB8ELK

Will anyone have an Echolink Link node listening on the simplex repeater frequency or one of the coordination frequencies during the flights there?

Hi Gerry,
Great! Note that we don't put the balloon beacons on the 144.39 backbone since they see an 800-mile diameter circle on the earth when at altitude. We will have beacons on 445.975, 144.340 and 145.600 MHz. Which of these can you I-gate?

BTW, check gpsl.eoss.org for further re GPSL details. The freq allocation page will be corrected later today.

It will be nice, but not essential, for the EOSS KD team to track
all 6 balloons, since ANSR, TVNSP, ES-OS and Mt State are taking
responsibility for their respective recoveries. So I'd urge the
EOSS team to focus mainly on EOSS-67A (W5VSI-11 on 144.34 and K0YUK-11
on 445.975 w/ DF on 147.555) until recovery is certain. Afterwards,
and of course if one of the other teams requests help, then of course,
do whatever's necessary to effect 100% recovery of all 6 payload
strings.

Hi Jack and Mike,

No -- putting your GGA on 445.975 at 20 sec past the GPS minute once
per minute should do nicely. We have most of our time-slotted beacons
on there now, and we have only a limited number of I-gate ground
stations
available, and the best that any one can do is to gate one 70cm
and on 2m freq at a time.

I understand that you will also have some heavier downlinks on 445.950
as well? Plus your crossband on 145.56 up / 445.525 down?

Hi All,

I've attached my best shot at assigning APRS beacons for all 6
balloons with the goal of ensuring I-gating thru findu.com to the
FAA controllers.

Let me know ASAP if you can't make these beacons happen.

Hi Ralph and John,

Ralph: your CD has arrived & we'll show it during the afternoon session
Friday. Thanks!

John: We've got you plus one logged on for the conference and the
banquet. Note also that we will be having a dinner 7 briefing Thurs
6/12 at 7:00 PM at the SouperSalad, 2595 Canyon. - hope to see you
there!

Topic: 504 Message: 504

Hi All,

For all all launch crews and those joining us from out of town, there will be dinner & briefing by Chris Koehler of CU at the SouperSalad, 2595 Canyon Blvd near the campus, on Thurs 12 June at 7:00 PM. We'll work out any last-minute hitches there.

So far, I have eleven folks planning to attend the Friday conference. Bill Brown and Ralph Wallio will also be attending virtually, thru electronic presence.

Here's the agenda for Friday:

0900 - Open the Eaton Conference Room in CU Eng'g; greet attendees. Donuts, bagels & coffee - courtesy EOSS/honor jar.
0945 - ANSR DVD showing
1000 - Mike Gray: ANSR Projects
1100 - Bill Brown: Rockoon Project, via PowerPoint & Echolink
1145 - Russ Chadwick: I-gating Balloon APRS beacons to FAA Controllers
1215 - Lunch: BlackJack Pizza delivery @ $5.50 per large, single + pop.
1300 - Paul Verhage: TVNSP Projects
1400 - Ralph Wallio: Balloon Radio Range analysis (PP w/ .wav narration)
1430 - Break
1500 - GPSL / EOSS-67 flight planning, forecasts, loose ends.

1700 - GPSL Banquet at Turley's, 2350 Arapahoe (entrees $8 - $15)

1900 - EOSS-67 Preflight Net, 147.225/107.2 Hz CRA rptr - linked to 145.460 in Boulder.

There are some last-minute changes to the beacon allocation published previously. I'll get out a final version when all the cats get herded.

From: Mike Manes
Topic: 500 Message: 505

Hi Paul,

OK -- these are a TinyTrak2 and a TinyTrak3 on 2m only, right?
Then can you set both of them to beacon in the non-Mic-E (i.e.,
human-readable) formats? This way we can track you at the ground
station in case I-gating is lost.

Please put the TT3 on 144.34, time-slotted at 0:30 sec after the
minute, and the TT2 0n 145.600 slotted at 0:25 sec, both w/ 1 minute
beacon intervals. The .34 will be shared w/ VSI-11 @ 0:10 and MFJ-11
@ 0:15. MFJ is using a D7 which can be time slotted only on startup
and paced by its internal clock - it does have CD collison avoidance
however.

Re the 70 cm CW beacon: That's fine, but PLEASE don't put it on
445.975, 445.950 or 445.525 - these are already in use for APRS
downlinks and the ANSR crossband repeater.

BTW, when do you plan on arriving in the Booulder area and how
can we reach you once you're here? If you will have a cell phone,
could you pass the number on to me in case we lose contact in the
field?

I look forward to seeing you at the dinner & briefing at the
SouperSalad, 2595 Canyon Blvd, Boulder Thurs 6/12 at 7:00 PM.

Mike, can others of us, that can't make it in person, also listen in on echolink or something?

Just a question, not worth any effort to think about it. ;-) I'm not familar with echolink. Not sure if it is like IRLP where more than one can connect and listen.

507. EOSS-67 launch schedule advanced to 0700 Sat

Yahoo group: GPSL (2002 — 2008)
Date: 2003-06-12 18:22:08 UTC
From: Mike Manes
Topic: 507 Message: 507

Hi All,

About 1020 this morning, I received a call from Mr. Greg Dyer, Mgr of Denver Center Airways & Procedures, insisting that ALL GPSL / CU SGC Workshop balloon payload be on the deck no later than 9:30 AM MDST due to expected heavy commercial air traffic after that time. This demand appeared to be non-negotiable.

After conferring with Chris Koehler of CU SpaceGrant College, we have agreed that the most acceptable alternative will be to comply with Mr. Dyer's request. Accordingly, we must plan to have all 6 balloons aloft from Deer Trail no later than 0700 (7AM) Saturday.

The SGC students plan on arriving at Deer Trail with all their payloads pre-strung at 6AM, but due to the complexity related to this multiple launch, it's important that we plan on arriving to set up at T-2:30, or 0430 (4:30AM). For those of us in the western burbs, plan on at least a 1-hour drive. I plan to hit the road in the >>E-van<< at 0300.

Sunrise Saturday is 0531, so plan on setting up in darkness! I will hope that we can get an OK to turn on the ballfield lights, but this may unnecessarily disturb the peace of Deer Trail citizens.

In order to allow for some sleep Friday night, I have decided to cancel the GPSL Banquet, previously set for 5:00 PM Friday. I will be back home by that time, and since EOSS is the host, I wouldn't be much of a banquet. Those staying Boulder may make their own plans. The prelaunch net remains set for 7:00 PM Friday on 147.225.

My apologies for this last-minute change. No good deed goes unpunished.

Isn't Deer Trail outside DEN Class B airspace, the Mode C 30 NM ring, and all payloads comply with FAR 101? Why is the FAA dictating launch schedule?

From: n9xtn@cox.net
Topic: 507 Message: 509

Mike,

NSTAR will adjust to match, and although this will mean a bit less sleep for us, going earlier should help us get calmer winds.

Since your launches must be not later than 0700 MDT, can we also assume a not-earlier-than time? We'd like to get as close as possible to your release time. If you set a hard window of 0630-0700 MDT (1230-1300 UTC), we can plan to release at 1245 UTC.

NSTAR will be filing its NOTAM early tomorrow afternoon.

Mark,

EOSS-67 is launching at 0700 (1300Z) vice 0900 at Denver Center
request to be on deck before the 0930 rush around DIA.

From: wb8elk@aol.com
Topic: 511 Message: 511

Weather is not looking good for Saturday morning here in Alabama so it's unlikely I'll be able to get something in the air then.....I was wondering if anyone will have an Echolink gateway set up for any of the balloon frequencies?

I'd love a copy of any videotapes taken during the flights on Saturday...and the talks on Friday....those of you who tape the event, please contact me and I'd be happy to cover costs for copies and mailing.

Rick...do you have a Webcam that you can setup on Netmeeting so folks can watch virtually during the talks?

Bill,

I'm hoping to have the ANSR cross band repeater setup on an IRLP node. If I can, you'll be able to connect to reflector node 9255. I just need to get someone who has a Colorado based IRLP node to reconfigure their radio for cross mode.

If not, join us on our next ANSR flight on July 5th. We have been running IRLP on the past few flights.

514. NSTAR 03-C successfully recovered

Yahoo group: GPSL (2002 — 2008)
Date: 2003-06-14 16:37:39 UTC
From: Mark Conner
Topic: 514 Message: 514

Only problem today is that the balloon burst at 81K instead of the expected 98K. Primary and backup beacons and the simplex repeater all functioned OK - several simplex repeater and digi contacts noted. The videotape ran to just a few minutes before touchdown - ran out of tape. I'm headed to Wal-Mart shortly with the still camera film - we did open the shutter this time.

Thanks to all who logged and chased. We were about 1/4 mi away at touchdown and saw the landing. I had a brief visual when it was at 22K and descending, but lost it in the sun thereafter.

From: Mark Conner
Topic: 515 Message: 515

http://www.nstar.org/NSTAR03C/NSTAR03C-air.html

You can see the balloon shadow in the first two.

The videotape is probably one of the best we've gotten to date. Good mix of sky and ground through the flight. I think we could see the chase vehicles in some frames near the end. Pretty stable, no "excessive" rotation. We were probably within a couple of minutes of having enough tape to catch the landing. The next flight will be on a 350g balloon and should get it.

I'll be updating the web site tomorrow (I think - need to mow or hay-bale my yard, too).

From: Ralph Wallio, W0RPK
Topic: 517 Message: 517

I am sifting through chicken tracks (engineering speak for 'evidence') of GPSL2003 flights and find a few potential record entries. I will post these additions when our usual suspects submit required information.

W5VSI-11 Lowest Reported Maximum Altitude 46,595ftASL - ~5,000ftGL = ~41,595ftAGL (5th place)

KD7LMO-11 Highest GPS Reported Altitude 99,288ftASL (11th place)

KD7LMO-11 Shortest Great Circle Distance, Release to Touchdown 2.1miles (1st place)

KC0JHQ-11 Highest GPS Reported Altitude 106,299ftASL (6th place)

KC0JHQ-11 Longest Mission in Time, Release to Touchdown ~4hrs (~4th place but APRS data on findu does not include time stamps)

KD4STH-11 Highest GPS Reported Altitude 98,242ftASL (13th place)

There was a 5th balloon stack but I don't know call(s)

Total Missions Flown count increases.

Hi Mark,

As you probably know by now, the only GPSL digi-capable TNC on 144.34 was W5VSI-11, and we stalled out at 47K' and had to cut down early. However, you might have heard any of these other beacons, all of which hit 90k'+: KD7MFJ-11 (Mt. State), KD4STH-11, -9 or KD7HGS-11 (TVNSP) also time-slotted on 144.34.

EBBE remains vexingly elusive!

Hi Paul,

I've zipped up the unexpurgated log file from the EOSS67 Ground Station.
As you can imagine, it's rather cumbersome.

I spent most of the time on 144.34, but QSYed from time to time, so
there are some gaps. THe biggest gap was between yerz trooly's ears,
however, who neglected to open the log file until nearly an hour
after launch. But I do show 'STH and 'HGS down to under 7000 in
descent.

Perhaps others out there have logs that can fill in the gaps.

Mike,

I don't think any of the other payloads were set to digipeat via NSTAR. I checked the MHEARD log and the only callsign heard other than those on the chase was W0RPK. I went through two log captures on 144.34 (W0RPK and my home station) and nothing that way either.

We only got to 81,000 ft, which was a ways short for a 1200g Kaysam.

I have captured the entire Internet feed for the GPSL flights - this will included anything received at the I-gates but perhaps not saved by FindU (telemetry frames, etc.). If anyone is interested I'll make it available. It's about 6 Mbytes zipped.

Not to worry, it's on findu.com and you can get it.

Try this:

http://www.findu.com/cgi-bin/raw.cgi?call=kd4sth-11&start=96&length=48&time=1
or

http://www.findu.com/cgi-bin/raw.cgi?call=kc0jhq-11&start=96&length=48&time=1

note that you'll need to adjust the start and length
time (in hours) relative to what time you are making
the query.

Thanks to Bill Beach for cluing me in to this
capbility of findu.com.

Hi Mark,

A couple of time during the flight, I connected to BALNOD, the
K-node on W5VSI-11, and did a JHeard list - just locals and other
GPSL balloons. Murphy appears to have a strong hand in this EBBE
business!

Try us again on 12 July and 2 Aug -- we will have at least 2 balloons
up on each of those flights, and one will be carrying the W5VSI-11 TNC.

Hi Bill,

It was great meeting with you and your team again this year, and hope this becomes an annual event! By next year, I hope to have found a launch site which will alleviate FAA's concerns, allows for some westerly drift and which is not much farther from Boulder.

Not that I'm volunteering to host a joint Workshop / GPSL again, however! That'll be up to another group, I hope.

Rick, EOSS's webmaster and Imperator of the Internet, will get this email and post your link on ours, and thanks for plugging EOSS on yours. With all this new latex and gas flying about, I hope our friends at the FAA will adopt some more modern methods for passing our position reports to the sector controllers - I think we have taken it about as far as we can.

Congratulations on another successful flight, and please consider posting your future flight announcements on any of the widely-read ballooning email reflectors. There are plenty of others out there who will be very interested in your program, and you can learn about what the rest of us are doing as well.

I've placed links to all the participating groups at:

http://gpsl.eoss.org

These links point directly to GPSL 2003 recap pages unless they haven't
been posted yet. In that case the link goes to the home page of the
group.

Your recap page is included, Bill.

BTW, nice pictures. I photoshopped the payoff picture of the ground
below the balloon. Very nice detail hidden away there!

From: Mark Conner
Topic: 528 Message: 528

I have enhanced the aerial photos, included ground photos, and now have a map and flight summary posted to http://www.nstar.org/#03C. I hope to have video and audio clips posted by Sunday evening. Kurt KC0HMI got a good photo of the capsules about 200 ft AGL on the way down, which is featured on the main page.

Doug KA0O got some telephoto pictures of the landing, which I'm hoping to see soon (hint, hint, Doug). :)

From: Mike Manes
Topic: 529 Message: 529

Hi, yawl,

Thanks to Mark for pulling those down. Kinda surprised that there weren't more PIREPs during GPSL.

As I read that first one, a Lear Jet LJ60) reported to Denver Center (ZDV) seeing one at 36,000 ft (FL360) at 0855 MDST (1455Z) 20 mile NW of the Black Forest VOR (BRK 340020). That VOR is about 2 miles W of Falcon CO, and about 20 NE of Colo Sprgs. So that mighta been one of the GPSL balloons, but not sure which one was still intact at that time. EOSS-67A was on the deck at 0850, and the rest of the latex bags were either 'way up there or already descending on 'chutes. Mighta been the ES-OS plastic balloon much higher than 36K' at that time, though; can't tell since the findu log for KC0JHQ-11 isn't time-stamped. Maybe the PIREP altitude is for the rerporting aircraft rather than the balloon (tough to estimate unless it's right on the horizon).

The other two were on the incorrect side of the MS River to be ours.

From: Mark Conner
Topic: 529 Message: 530

The COS report was the same date as the others for the Detroit flight (Sunday the 22nd), so it wasn't a GPSL balloon. No balloon PIREPs were found for the 14th.

From: paul.verhage@boiseschools.org
Topic: 531 Message: 531

I'd like to hold GPSL 2004 at the Cosmosphere, in Hutchinson, KS. The Cosmosphere is the second largest air and space museum in the US. There is an active near space group and radio club in Hutch, so there is plenty of support.

Would this be a problem for anyone? The tentative date would be a week before the 4th of July holiday. I imagine people will be too busy on the 4th to participate.

Inputs please.

Thanks,
Paul

Assuming Zack Clobes, W0ZC, the Project Traveler Team and the Reno County Kansas Amateur Radio Association will be our hosts, I support Paul's suggestion. It takes at least a full day to do justice to the Cosmosphere (they threw me out to close their doors for the evening during my visit a couple of years ago). This is a very serious space museum that is worth a special trip regardless of GPSL.

See http://www.rckara.org/ then http://www.rckara.org/project_traveler/ then http://www.cosmo.org/.

I think we can get a quorum from NSTAR to participate.

We may need to get Zack to scout an alternate launch site in case we need it. Wichita, Newton, McPherson, and the Cheney Reservoir are all within 40 miles of Hutchinson.

July 4th is a Sunday, so the federal holiday will be the 5th. The long weekend may give some groups more flexibility. Perhaps we should have a show of hands on whether we have this on 3/4 July or 26/27 June.

Would we launch from the museum grounds, or somewhere nearby? As I recall, there may not be a lot of room for multiple flights especially if we have a breeze.

I think the Cosmosphere grounds may be a little cramped to do a multi-balloon launch there. There is a football field just across the parking lot where we've had field day before, but as I recall, we were not allowed to step foot onto the turf itself - we were banned to one edge of the field.

I will start thinking about alternates...

Doug KA0O brought up that 26/27 June 2004 is Field Day weekend.
Is that going to constrain or help us?

My vote is for the long July 4th weekend for GPSL2004.

The Cosmosphere environment would nicely support a day of conference discussions. These discussions may result in a few new Traveler Team members.

Should we promote a contest and recognition during the mass launch for a goal such as highest altitude?

It is Zack and his team.

I hear the Cosmosphere always throws out the best people.

I think most near space people subscribe to this list.....

I am wondering about the number of people involved in amateur near space activities. Can someone from each group tell me (a rough number will do) how many people are involved in their group? Also, how many people were actiove, but have dropped out.

I'd like to add this as a note to my book.

Thanks for your time,
Paul

It would be nice to lauynch at the museum, but if we can't....

Zack, do you have recommendations for launch sites?

I at least want us to present at the museum and also run Mission Control from there. That way we get more public exposure.

Zack, what do have to do to arrangte this with the museum? I don't think they'll remember me anymore.

I like the idea. Perhaps we should also make some QSL cards specifically for GPSL 2004 and send those out to anyone making a contact to Mission Control through one of the balloons.

Several of us now have some really nice pictures for the cards. I'd also0 recommend sending the cards up on the balloons and recording the altitudes the QSL cards reached before sending them out.

As soon as we can lock in the Cosmosphere, let's see about passing the word out to all the amateur radio magazines.

Paul

Date:
I'm available for either date but I'd prefer to stay away from Field Day personally. On the other hand, those who wanted to operate would be more than welcome to join the local radio club's event.

Launch Site:
I think we can find plenty of launch sites around here - after all, this is Kansas. We usually launch from a field inside of the city, just a mile or so from the Cosmosphere. There's also an old Navy ?airbase? about 10 miles south of town that is all but abandoned... they fly gliders off of it occasionally.

As I said in the email directly to you, I think we could fly from the main airport in town and I could probably get us into the hangars for filling and prep'ing.

There's also two model airplane fields just outside of town - one about 8 miles south-west and one about 5 miles north. I've got contacts at both of those.

Cosmosphere:
My two concerns with the Cosmosphere are #1 there isn't much room for a launch site (I can try to get a few pictures taken of the area and post them up here). and #2, with their tight budget, they're really not up to giving anyone a free ride with meeting rooms right now. I think they charge something in the neighborhood of $100-$250 per day to use their big meeting room. I don't think having a mission control for public view would be any problem though... Our radio club has had several special event stations in their lobby area without any problem. In fact, I think they were happy to have us.

Currently we have a radio station setup with 2m and HF. I'm a little scared that may get axed in all of their restructuring, but if it does, they've let us run coaxes out some of the emergency exits to setup temporary stations. We now have two mobile towers in town that would probably be available if you wanted to use az-el rotators for ATV or something.

If you would like, I can try to get some firm pricing and availablity. We've tried pulling strings before, and we've never had much luck - even with the local school system kids using the meeting room.

We may need to move more like 20 miles, esp. if the forecast
track is to the SE towards Wichita. Perhaps something like
Kingman, Lyons, McPherson, or Newton as alternates (all of which
have small airports).

Hi Paul,

Rough numbers are good! It would take some digging in the EOSS archives to arrive at precise figures, so I'll rely on my failing memory and a little help from the other EOSS ol' timers copied here.

Within it's first year, EOSS paid membership hit about 100, and attendance at monthly meetings typically exceeded 60, making venues tough to find!

Since those halcyon days, membership gradually declined, to a low of 20 or 30 in late '98. Not sure why, but it was probably some combination of loss of membership perks like free internet access via the CommPost FIDO board and regular mailings of the "Stratosphere" newsletter, plus some "been there, done that, ..." and loss of most of our school contacts. That year was marked by but a single EOSS flight.

Faced with the gloomy propect of dissolution, Marty Griffin WA0GEH proposed the inspired concept of hosting a competitive "flying foxhunt" open to all hams along the Front Range, with a convenient late-morning launch from a popular park. The big draw were some prizes to be awarded to successful hunters, including a Garmin GPS, at the following EOSS meeting. It worked! , and EOSS's membership became infused with a whole raft of enthusiastic new blood, eager to do it again!

About that time, Chris Koehler of CU Space Grant launched his "Gateway to Space" undergrad class, where students design and build small balloon-borne experiments modelled after the NASA Cubesat spec. Chris approached EOSS for launch and recovery services, having seen what we could do some years earlier when he led the Martin Marietta Explorers with some earlier balloon experiements.

It's been uphill since then, with EOSS membership now about 50, and a flight schedule of about once per month, each of which directly involves from 15 to 25 members -- not to mention the 50 to 85 students whose precious creations are sent aloft and recovered by the dauntless EOSS KD Team!

Now, I will openly invite you others to run fact checks on these specifics and get corrections, additions off to Paul before press time!

The last I recall hearing from Zack was that they would be happy to be our host in Hutchinson. It seems reasonable for Paul to be a distant Trail Boss for GPSL2004 but we need local hosts for lodging, meal, conference, launch and other arrangements.

I also recall Zack mentioning a significant charge for conference facilities in the Cosmosphere, perhaps $200. In my opinion this is a heck of deal if it includes access to the Cosmosphere Museum for all attendees. If we could entice 40 attendees to be with us this would be only ~$5 apiece. A normal adult ticket costs $11 including an IMAX show.

I just gave them a quick call to ask a few questions.

First of all, the main room is not available on Friday 3 July until after 6:30pm. It is available on Fri 9 July all day. That room costs $225 for the day. There is Internet access available (I gathered it was a bring-your-own-computer type of setup).

They have an "observation deck" that I believe is available on any of the Fridays for $125 but I wouldn't recommend it. It is not enclosed at all and it overlooks the main lobby of the Cosmosphere. She didn't recommend the observation deck for anything other than evening use because there is a lot of traffic through the area with staff going to and from the main office. It can seat 40-50 people, and there is no way to dim the lights or even a front of the room to setup a projection screen.

Tickets are not included with the room rental fees. For out-of-county passes, the mueseum costs $3 to go through. They do offer a discounted rate on the IMAX passes of $5 each if they are purchased in conjunction with the room rental. I didn't ask about it, but I believe they also have group rates available even if we don't rent a room from them.

On the bright side, the lady was very receptive to having us setup a radio booth during that Saturday - either at our club station (assuming it's still around - they've moved us a couple of times lately) or a temporary station and running coax out the side door. She was going to get approval on that and get back with me by the end of the week.

Hi Bill,

Thanks for the announcement. You might get wider distribution by
posting future launch announcements to the other reflectors
cc'ed above - not sure how may are on the GPSL reflector any more.

Happy landings, and congrats for getting into the BallonSat business!

565. ATV Balloon to be flown over Ohio Saturday Nov 29 at 11:30 am EST

Yahoo group: GPSL (2002 — 2008)
Date: 2003-11-28 21:49:56 UTC
From: wb8elk@aol.com
Topic: 565 Message: 565

Suntracker 8 balloon will be flown from Portland, Indiana at 11:30 am EST...about a 2 hour flight time...predicted landing site is in the Hillsboro, Ohio area just 30 miles east of Cincinnati....flight path will take it directly over the Dayton area.

For those in the South....reception is possible as far south as Alabama and Georgia.

Bob UVY, I don't have the St. Louis ATVers email addresses...can you forward to them?
KU4WW, can you forward to KD4NOQ...I lost his email address.

ATV - 439.25 MHz
Packet APRS - 144.34
Callsign - KC8MSY

567. Peacestar Balloon help

Yahoo group: GPSL (2002 — 2008)
Date: 2003-12-01 08:44:49 UTC
From: wb8elk@aol.com
Topic: 567 Message: 567

A group called Peacestar has contacted me about flying a zero pressure balloon across the country just before Christmas (Dec.20 or 21)....the idea is to have a strobe lamp below the balloon lighting up the envelope at night and also it should be pretty visible during the day.....to simulate the Christmas star.

I'm putting together an APRS payload for it with solar panels....and an ATV payload that can be turned on from time to time.

Raven is supplying the balloon, if we can get it high enough during the day (130 or 140k), it could stay in the air for another day or two without coming down through the tropopause....although we may carry a little ballast on it just to make sure.

I'm currently looking for a launchsite or group willing to help out with getting this off the ground....they want to be able to fly from the West and cut it down before it hits the Atlantic....this time of year that may only take less than 2 days.

Although California might be the ideal place for the farthest distance across the country, I think it would be best to fly from an established balloon group area.

Let me know if any of you are interested in helping out with launchsite, payload, tracking, etc.

Hi Bill

Count the Kansas City Amateur Television Group in with at least tracking. Keep the group advised as what, where, and when as this sounds very interesting. Thanks

P.S. I am looking for plans to build a 432 square loop antenna for the mobile and can't find the site it was at a while back. Any help? Thanks de kd0fw Mike.

573. Swiss Adverturer Plans Around-the-World Solar Flight

Not a balloon but very interesting nonetheless:

Swiss Adverturer Plans Around-the-World Solar Flight
Solar Impulse to be world's first fuel-free plane

Source: Reuters
[Nov 29, 2003]

LAUSANNE, Switzerland (Reuters) - Swiss adventurer Bertrand Piccard, the first man to pilot a balloon around the world non-stop, has announced plans to circle the planet in a specially built solar-powered aircraft.

Piccard, who circumnavigated the earth in 1999 with Brian Jones of Britain, will lead a team of scientists and aviators in his attempt to fly around the world in a fuel-free plane -- to be called Solar Impulse.

"A century after the Wright brothers' first flight, we look forward to adding new pages to solar aviation," Piccard, 54, said. "It is a colossal challenge."

Lausanne's Federal Institute of Technology will help Piccard's team build an aircraft that can store enough power to stay in the air throughout the night.

See http://www.solar-impulse.com/en/index.php for the complete story.

Forward to group lists as desired.

Hi Mark,

Hutchinson looks like about 400 mi from Denver and an hour S of Salina.
Last time I looked, EOSS had a contingent interested in GPSL '04, and
we have kept that weekend open for EOSS-82. I'll start soliciting
for committments and keep you posted,

If other teams are interested, we can fly the EOSS APRS / TNC module
this time for some EB....BE stuff on 144.34. And we'll avoid any
beacons on the 147.555 Skywarn simplex freq this time! 145.60 instead.

Assuming that it is there and coax is run, we can certainly use it.

They've moved us around a time or two, and currently we don't have a permanent home, and therefore, no coax inside the building. Hopefully that will be changing before GPSL.

We'll need to get back in touch with the CSphere, but they've given us permission to setup an 8' table near an emergency exit with antennas outside. Jon (a local) has a tower-on-a-trailer that we can setup to get some elevation.

583. GPSL 2004

Yahoo group: GPSL (2002 — 2008)
Date: 2003-12-13 02:14:06 UTC
From: Zack Clobes
Topic: 531 Message: 583

Thanks to everyone for stating their flight and travel intentions. I have begun to compile this information on the website at www.rckara.org/project_traveler/gpsl/.

For those of you planning on flying a capsule, I would appreceiate if you would email me with the details (see the example for Project: Traveler).

We also have some details to firm up such as telemetry frequency, chase frequencies, etc.

Zack Clobes, W0ZC

Can anyone point me in the right direction for setting up a APRS node at my house for GPSL? I've got a Linux server sitting there doing nothing that I would prefer to use if the software is readily available.

If all you want is I-gate functionality, try APRSD. http://sourceforge.net/projects/aprsd/

XASTIR is the full APRS client, and appears to have I-gate functionality as well. http://www.xastir.org/

I briefly used APRSD way back when - was playing around with Linux on a laptop. I'm not familiar with XASTIR at all.

Is there any interest in creating a product for GPSL 2004? Cafepress.com will let us upload some artwork and create things like mugs and t-shirts. The profits could go to paying for GPSL related costs, like helium.

Let me know what you think.

588. Li ion Batteries

All Electronics is selling 1200 mah li ion batteries for cell phones for $6.50. the recharger is $4.50. I was able to solder wires to the battery and wrap in it heat shrink. I also shorted the two metal spring plates inside the recharger and soldered wires to them. This way I could terminate the battery in a connector for my near spacecraft and still recharge them.

Li ion are nice because they don't suffer from memory effect and can handle low temps.

Paul

Hi Paul,

I'm guessing that the market for GPSL mementos will be not much
different from that for the balloons and gas -- so rather than
marking up the mementos, sell the mementos, balloons and gas at cost
to keep things simple.

Hi Paul,

Bill K0UT tells me that Li ion batts don't share the low-temp tolerance
of LiSO2 cells. And in fact, they may be less tolerant of cold than
NiMH.

If you get some, could you do some cold-soak capacity tests? I'd sure
like to get away from the tedious task of replacing payload batts for
every flight and adding to what has become a rather large mound of
used LiSO2 cells!

http://www.batteryuniversity.com/partone-15.htm

"At low temperatures, the performance of all battery chemistries drops drastically. While -20?C (-4?F) is threshold at which the nickel-metal-hydride, sealed lead-acid and lithium-ion battery cease to function, the nickel-cadmium can go down to -40?C (-40?F). At that frigid temperature, the nickel-cadmium is limited to a discharge rate of 0.2C (5 hour rate). There are new types of Li?ion batteries that are said to operate down to -40?C."

Note that the old heavy NiCd's are the best for cold performance among the rechargeables.

LiSO2 still operates at -40?C but also at reduced capacity.
http://voltaicpower.com/Batteries/high-disch-lith.htm

I have some lithium-polymer batteries that I'll be testing for the NSTAR payload in the next few weeks, to replace the NiMH pack currently in use. The testing will include some cold performance tests.

Hi Mark,

Thanks for the treatise. I'm cc'ing Bill on this as well. His cell phone w/ Li ion died during first call of the AM at EOSS-72 (cold!!).

And glad to get a confirmation on the LiSO2 -- I guess .... BTW, since those priamry cells do dissipate a bit in the internal resistance under load, I rather doubt they'll ever see -40C during a typical balloon flight while they're loaded. The LiSO2 cells most likely to "chill out" are the one I use to fire the cutdown burner wire - they're unloaded except when burning, and are carried in a 0.33" thick foamcore box inside the parachute canopy. But I can get over ten 10-sec 4+A burns out of 'em.

Guess if I go to Li-ion, it'll take a cold-soak and flight qual before I rely on 'em. Oh, and maybe the Li polymers will perform better ...

Yo Jackson!

Well, I was kinda hoping to have had an eyeball with you one last time
before you pulled the plug on Ma Martin. Oh well ... maybe yer pension
can support an occasional X-country up to Centennial from time to time.

EOSS is gonna have a larger presence at GPSL this year - besides the
4 of us who did GPSL '02, Benji W0CBH and Larry N0NDM will be joining
us, and there may even be some more (N0LP?). To top that off, Chris
Koelhler will be bringing out his annual Upward Bound native American
student group with 8 lb of their BalloonSats - our summer flight sked
is already booked to the gills, so this was the only slot that worked.

Maybe an ANSR contingent will show up anyway.

Looking forward to some pix of the new QTH.

Topic: 602 Message: 602

Okay, folks, GPSL 2004 has two competitions and Parallax and Nuts and Volts magazine are sponsors for GPSL 2004.

The competitions for GPSL 2004 are,
Highest Altitude
Closest Landing Prediction

The highest altitude award is for the person claiming the balloon as their own. If it's a team effort, the team will have to work out who gets what.

Should we limit the predictions to just your balloon? If we don't, we may get dozens of predictions to sort through.

Both winners receive a one year subscription to Nuts and Volts and a Basic Stamp 2p.

This should be an awesome GPSL. I'll be covering GPSL 2004 for Nuts and Volts magazine. Expect to see me running around get photos and asking for comments.

Paul

PS, be looking for my atrticles in the Feb and March issue of Nuts and Volts. Also look for special announcment in the March issue.

From: Mike Manes
Topic: 602 Message: 606

Hi Folks,

Chris Koehler of Colorado Space Grant Consortium has asked EOSS to provide launch and recovery services for the 2004 Upward Bound BalloonSat class. This class comprises the winners of a nationwide competition amongst Native Americans and other minority high school students. It was a real pleasure to see the delight and enthusiasm of these kids during the 2003 Upward Bound flight!

EOSS is honored to provide this service, but due to an already full flight docket and a limited time window, Chris has agreed to bring his students and their BalloonSat payloads out to GPSL 2004 to fly on the EOSS string. He's agreed to limit the total BalloonSat weight to under 8 lb in order to keep us FAR-101 exempt. However, he could fly more or heavier BalloonSats if there were some spare payload capacity on some of the other GPSL flight strings.

BalloonSats are 10 cm cubes that typically weigh in at 450-600 gm each, are self-contained and generate no RF emissions. They are attached to the flight string using 3mm dacron cord passing thru a central support tube.

Chris would prefer to keep all the BalloonSats on a single string in order to avoid multiple recovery chases, but if GPSL '02 is any indication, we should all land within 5 miles of one another and could easily coordinate multiple recoveries on 2m simplex. Note that since the BalloonSat experiment data is stored on board, recovery is essential.

Any takers?

Paul: how about adding 10K' in "bonus" altitude for each BalloonSat carried up and recovered :=}?

Let me think about that. I'm worried that 10,000 feet is a little excessive. How does everyone else feel about that?

Paul

I'd say leave that out of the contests.

If we came up with any other sponsors that could provide several small prizes, we could use them. One possibility would be the Radio Shack in Derby Kansas (just south of Wichita) - they specialize in ham gear and have donated stuff to our local radio club before for prizes, etc.

Thanks, Paul! A few more, and maybe we'll free up enough exempt
budget to haul up the crossband repeater and/or the ATV module.

Note that EOSS expects to have a larger contingent at GPSL '04,
so there's been a proposal that EOSS pop up TWO flight strings for
even even MORE "fun" payloads!

We've also been getting some inquiries re cheap rooms, whether there'll
be a GPSL hotel/conference center, etc. WE'll need to get accomodation
info out to Chris Koehler for the Upward Bound students as well. Who's
taking on that task?

From: Zack Clobes
Topic: 612 Message: 612

Several people have inquired location and accommodations for the 2004 GPSL. The 2004 site is being hosted by the Project: Traveler group and is contained on our webserver.

www.rckara.org/project_traveler/gpsl/

All information will eventually be on here... I already have room and board info, maps to the session, lat/lon for the primary launch site, etc...

If you have any questions, or would like to see something else, let me know and I will try to post it ASAP.

613. Would you like to give a presentation at GPSL?

Hi Zack,

Thanks for putting that web site together.

EOSS plans to participate at GPSL '04, and hopes to be supporting
an Upward Bound class of students sponsored by Colorado Space Grant
Consortium. This may involve our launching two balloons. I will
send you details for the Scehduled Flights page as soon as details
are known.

I'd like to add a photograph of chase crews at lunch after a recovery. Does someone have aphoto from one of the GPSLs? I can't find my original. I'll give credit in the book.

By the way, I have completed all but two chapters. The last two require some photos and I should have them done by the end of the month (some of the photos are dependent on the weather). I believe the book will be out by GPSL 2004.

The following is a link to phots from GPSL 2003. The pictures feature educators from the NASA Space Grant group. There is also a photo with Bill Brown in it, which might go nicely with the history of high altitude ballooning as Bill was one of the first to fly high altitude ameteur balloons.

If you need the full size 2048 x 1536 color corrected images suitable for print publication let me know. I can send you a CD or post them on my web site. They are large though, around 3MB / image.

620. EOSS-74A launch postponed to Sun 22 Feb

Yahoo group: GPSL (2002 — 2008)
Date: 2004-02-20 22:55:10 UTC
From: Mike Manes
Topic: 620 Message: 620

Hi all,

Pardon the multiple deliveries.

The EOSS board has decided to postpone the launch of the EOSS-74A high altitude balloon from Sat 21 Feb to Sun 22 Feb at 0800 MST (1500Z), again from the Windsor CO Fatton Ranch site.

This change was prompted by a weather delay of NSTAR-04A to the same time Sunday. One of the flight goals is to establish an EBBE contact with NSTAR. ORB is also postponing similarly.

This change will be announced on the EOSS web site www.eoos.org and on tonight's preflight net on the Denver 147.225 repeater at 2000 MST. Another preflight net will be held Sat nite, same time, same station.

Launch conditions and forecast trajectory appear equally favorable for both days, and an extra day in the sun should dry up the launch area a bit.

Hi Zack,

During a recent telcon with Chris Koelhler, who coordinates the
Colo Space Grant Upward Bound program, liablity and logistics issues
will prevent the Upward Bound students from making it to Hutchinson
to fly with TVNSP and EOSS. Thanks to those who offered and considered
letting their payloads tag along on their flight strings.

I'm still solictiing suggestions from the EOSS membership re the
EOSS payload complement for GPSL.

We could bring out the crossband repeater again, but during GPSL 2002,
we got zapped by KS Skywarn for hitting their "private" 147.555 simplex
net freq - that module is rockbound on that freq so I'm not inclined to
re-xtal it to another possibly "private" freq. Is .555 in use in the
Wichita area?

And from the web site, I see that several other groups are planning
on flying 70cm ATV, so that band is looking pretty full already. We
could bring out the de-spun ATV for show and tell, but won't fly it
unless 426.25 is going unused. By that time, however, I hope to have
a command rcvr installed to let us QRT the xmtr - time will tell.

Another option is a simplex repeater on 70 cm or 2m.

As a minimum, we'll have the KPC-3+ APRS module on 144.34 plus a
DF beacon / cutdown cmd rcvr on another open 2m or 70 cm freq.

With this many payloads aloft from the same site at the same time,
frequency and time slotting coordination becomes a fairly important
hair-pulling exercise, Zack.

I think time slotting is going to be very important for this year's event.

Can someone please define EXACTLY what the accepted definition of time-slotted is? For example, if you're time-slotted at 10 seconds, when do you begin your transmit and how long do you have to transmit? Do you begin your transmission as soon as you decode the GPGGA string with 10 seconds in it, or do you start after you receive the 09 seconds?

Is six seconds per minute sufficient time for each group to transmit their needed data? That would give us 10 balloons on a single frequency with posits every 60 seconds.

Zack

K. Mark Caviezel wrote:

Zack: Mike raises an excellent point. I'll point out that the TinyTrak-supported "time slotting" function worked great for two payloads during GPSL 2003 (I think it was EOSS's K0YUK-11 and "ES-OS"'s KC0JHQ-11 beacons < I don't think the EOSS 67 recap fully captured all of the frequency assignments as there was some last minute juggling>). Since the time slotting is based off of GPS derived time, the relative timing can be very accurate, you could probably get reliable position updates once a minute from 30 or 60 TT based APRS trackers all sharing the same frequency. I know many of the groups coming to GPSL already have a TinyTrak and I will suggest that all groups could fly a beacon on one frequency such as 144.34 MHz and time slot them to enable QRM-free sharing of a single frequency. As long as no payload suffers from 'dead key up' this will work fine.

We'll rely on you to be the point contact for frequency co-ordination/QRM elimination. I'll submit a request to fly an APRS beacon on 144.34 MHz, one packet per minute at the top of the minute (:00). And, yes, I am sticking to my plans of flying a 1/2 million cubic foot plastic balloon at GPSL, with good prospect of capturing displacement and absolute altitude records. (although now I need to build this monster!)

- KMC

I think the definition should be that the actual transmission occurs between the seconds specified. The participant should program their device to "compute early" by the number of seconds necessary for formatting, etc., by their device.

Also, chase teams should ensure they have their ground stations disabled from transmitting on 144.34. We don't care where your car is, just your balloon. :-P

Subject: [GPSL] Re: GPSL Flights... time slotting to enable sharing 144.34 ?

I think time slotting is going to be very important for this year's event.

Can someone please define EXACTLY what the accepted definition of time-slotted is? For example, if you're time-slotted at 10 seconds, when do you begin your transmit and how long do you have to transmit? Do you begin your transmission as soon as you decode the GPGGA string with 10 seconds in it, or do you start after you receive the 09 seconds?

Is six seconds per minute sufficient time for each group to transmit their needed data? That would give us 10 balloons on a single frequency with posits every 60 seconds.

Zack

628. NSTAR's planned payload for GPSL

Yahoo group: GPSL (2002 — 2008)
Date: 2004-02-24 02:28:37 UTC
From: Mark Conner
Topic: 628 Message: 628

Main beacon: 144.34 MHz with 2m VFO, time-slottable for posits and telemetry (APRS posit format created by Basic Stamp)
Backup beacon: 144.39 MHz with 2m/70cm VFO, time-slottable, transmits posits only (Tiny Trak)

For our "fun" payload, we can either fly SSTV or a simplex repeater. For SSTV, we'd probably use 147.585 MHz unless that's a "bad" frequency in the Hutchinson area. We've used our simplex repeater on 446.30 MHz in Kansas, Iowa, and Nebraska with no ill effects. The radio used for this payload is 2m/70cm capable.

I think our voice comms should be on 70cm to avoid desense problems for the 2m downlinks.

NSTAR is pretty close to the 12-lb limit, so unfortunately we can't carry other payloads.

Hi Zack,

I think that 60-sec APRS reporting intervals should be plenty often
for the GPSL balloons. And the time-slotting is only necessary for
those APRS beacons that share a common beacon freq, e.g. 144.34. I
think ANSR uses a 70 cm freq for theirs, so they needn't time slot
if no one else is on freq. So probably 10-sec slots will suffice with
60-sec GGA beacons. Each beacon takes under 2 sec to transmit.

Now, time slotting works right only when all beacons are using identical
real time references, usually the time stamp on the GPS GGA sentence.
The TinTrak beacon and KPC-3+ beacons can be set up to time slot, but
the KPC-3+ requires you to preset a START time, after which the time
slotting will begin. This means that you gotta get a good GPS
acquistion
before the START time, which should be BEFORE launch! Takes some
godd guesswork and launch coordianation! On GPSL 2003, I blew it,
but was able to recover by going into remote sysop mode just moments
before launch and corrected the START time to 2 minutes later; it
worked.

631. Status of Book and Column

Yahoo group: GPSL (2002 — 2008)
Date: 2004-03-01 21:56:43 UTC
From: paul.verhage@boiseschools.org
Topic: 631 Message: 631

Parallax is planning to make my book a free download. Since I have finished writing it, I believe it will be available this summer.

My monthly column in Nuts and Volts magazine will expand on the content in my book. I also want it to introduce readers to what is currently happening in the world of near space, both amateur and professional.

On an irregular basis, I'd like to include an introduction to each currently active balloon group. I'd like each introduction to about 1/2 a page long. For every group written up in the introductions, I'll pay $50 to the group. If your group would like to be included, I need the following.

Name
When formed (a mini history would be good)
Location of launches (the region will be fine)
Type of instruments typically flown
Funniest incident
Greatest sucess
Point of contact
Photograph of the crew.

Use about 1/2 page of text in MS Word
You can send a photo and I'll ask to have it scanned. If it's already scanned, it has to be high resolution. But I'd rather just send the photo in and let N&V scan it.

Thanks,
Paul

PS, if there's topics you'd like to see covered, let me know. I'll email a list of topics I plan to cover

633. Time Slotting Definition

Yahoo group: GPSL (2002 — 2008)
Date: 2004-03-09 03:05:56 UTC
From: Zack Clobes
Topic: 633 Message: 633

I have written up a prototype of the time-slotting definition for GPSL.
Please review it and give me any feedback ASAP.

http://www.rckara.org/project_traveler/gpsl/time_slot.asp

Also, I don't have any experience with the TT/MIM modules. Could
someone please describe the process for configuring these modules to
transmit all (including telemetry?) data within a specific time frame.

Thanks,
Zack

I don't know if I could work something like that in time. However, I can keep the weight very low. I'd be interested in carrying a camera and some weather sensors.

I won't put any radios on it. That way it can't interfere with operations or tracking. I'll also make sure it doesn't fall a part, either!!

Thanks for the lift. I think I'll mount the camera to a scan platform. This way it can photo the ground, horizon, and balloon. It will carry a GPS reciever so it can record the altitude and time along with its data.

What's my weight limit? How do you want me to connect my payload to our balloon?

Paul

649. Verhage payload on "ES-OS" 'baby shamu' balloon

well, if you self-jettisonned, I'd limit your weight at 40 lbs, but since you're not going to do that, 3-4 lbs is do-able, right ? for payload attachment, I'm fine with probably any method you want as long it can withstand at least 100 lbs tensile pull. The flight string will be 250 lb tensile spectra. and btw, since you're flying a GPS unit in it, if you want to make it beacon APRS, you are more than invited to as I historically have flown some pretty sketchy APRS units and need all the help I can get!

For good photography, you'll probably want to be completely vertical. Right now, I'm not sure I can give you the bottom of the flight string, but if you put a top and bottom attach point so that payloads can fly underneath yours, then that's fine.

I'll keep the weight to 4 pounds, then. Thanks. I'll mount everything inside a box that has four attachment points. I don't know if I have the spare tracker, but I'll see what I can do.

For anyone else out there, do you have a space APRS tracker (lightweight) that could go inisde my module?

Paul

Paul, since you have GPS already onboard, you could
add something like this:
http://www.byonics.com/pockettracker/
to make a tracker out of it.

Hi Paul....my email is: wb8elk@...

73s de Bill WB8ELK

We are doing several flights from Univ of Alabama, Huntsville as part of a senior engineering BalloonSat class. The first flight will be April 10th and every weekend in April afterwards. I'll post details as plans get finalized. They did a series of flights last Fall which were quite successful.

I've updated my web site with technical information on a variety of high altitude balloon projects. The projects are all open source hardware/software and designed to MIL spec standards. Some of the highlights include:

S-Band (2.4 GHz) FM video transmitter and receiver:
http://www.kd7lmo.net/videolink.html
http://www.kd7lmo.net/ground_atv.html

Multi-standard HF-APRS system for OTH (Over The Horizon) tracking of floater type balloons. Software currently supports PSK-31, 300 band FSK APRS, and 1200 baud A-FSK APRS
http://www.kd7lmo.net/psk31.html

Non-primary (rechargeable) Lithium-Ion battery packs:
http://www.kd7lmo.net/tech_pwrsource.html

Very compact DC/DC power converter to reduce battery count and weight:
http://www.kd7lmo.net/tech_pwrconv_2.html

Hi Doug,

Welcome back to the now much larger balloonacy community! This
stuff has really taken off in recent years, and I've posted a
cc of this to a few of the balloon group email reflectors that
you might want to join. And take a peek at EOSS's web site,
www.eoss.org for more links, updates on our stuff, etc.

The NASA Space Grant Colleges have taken a shine to high altitude
balloons as a "poor man's space program" for aerospace undergrads.
You might see if there are any interested colleges in the DFW area
that you could link up with. Makes the activity a lot more like
a real public service!

As best as I know, we don't scan for visues when they get here. I've had to make it a practice to look at attachments as a text file.

Is someone's email faking your email address?

No, it was sent to the group. I looked at the headers in the e-mail. It
appears as though Ralph's e-mail address was harvested from a site and
used to send a message to the group. A clever attacker can modify the
e-mail headers to fool Yahoo into thinking it is a legitmate subscriber
to the group.

The moderator of the group should delete message #657. It contains a live
virus if you are running a PC. If you are running Linux and text based
e-mail, there are no worries. :)

Hi Ralph,

You got spooffed. The sender was your email address rather than
your more familiar "Ralph Wallio, W0RPK" email moniker. And the
Subject line was also atypical: "Re: Re: Message".

I got a spoofed spam from "myself" once, pushing a porn site, of all
things! I was so incenced that I set my son the warpath to launch
a DoS attack on the server that sent it. No more such nonsense
in last 2 years. The key to controlling spam lies with the servers'
acting to stop it - but until they all quit taking kickbacks, it'll
keep on coming.

667. Re: GPSL link on eoss home page?

Yahoo group: GPSL (2002 — 2008)
Date: 2004-05-09 18:25:15 UTC
From: Mike Manes
Topic: 667 Message: 667

Hi Rick and Zack,

Then I guess the reference to the Upward Bound students was on Zack's GPSL site.

Zack: it turns out that transport logistics prevent the Upward Bound students from joining us at GPSL 2004, so if that's really on your site, suggest dropping it. And I hope to have a final payload plan to post on your site after next Tuesday's EOSS meeting. Rest assured, EOSS will be there!

A couple of other issues:

1. Are you doing freq coordination for all the balloon beacons? One of our payloads is a crossband repeater with APRS packet overlaid on the downlink. The xmtr runs continuously and is rockbound on 147.555, and the uplink is xtalled on 445.975.

2. Any luck with time slotting the other APRS beacons? ANSR appears to have grabbed all the slots on their 445.950 downlink; we could accomodate a few slotted 60-sec interval APRS beacons on our crossband uplink, but if it's used extensively for tracker coordination, some of those beacons could be lost.

3. At GPSL 2002, we got gripes from the SKyWarn group near Manhattan for our downlink on 147.555, which they use for simplex coordination. Will this be an issue near Hutchinson?

And have any of the other groups settled on a motel yet? It would be nice to gather in the same place like we did last two GPSLs.

668. EOSS payloads and attendance for GPSL '04

Yahoo group: GPSL (2002 — 2008)
Date: 2004-05-14 17:50:21 UTC
From: Mike Manes
Topic: 668 Message: 668
Attachments: 1 described; binary payloads are missing from this source WARC

Hi Zack,

I've attached a draft payload plan for EOSS at GPSL this year. PLs add it to your web site info. It's in Word97 format. Let me know if you need it in another format. We can drop the crossband repeater if freqs are getting scarce, but do want to run the ATV, APRS and DF cutter as a minimum. The valvedown balloon is also a TBD.

So far, eight EOSS members plus some XYLs plan to attend GPSL. We'd like to stay in the same motel as the rest of the attendees, if one has been picked. Any recommendations?

And EOSS can fill an hour during the Friday seminar - possible topics include: Tracking, FAA reporting via findu, Allaiances with Space Grant Colleges, national balloon organization. Depends on what the rest of the group is interested in hearing.

670. GPSL Preparations

Yahoo group: GPSL (2002 — 2008)
Date: 2004-05-20 02:44:39 UTC
From: Zack Clobes
Topic: 670 Message: 670

First of all, let me say that I'm sorry for not keeping the website more up-to-date and better at responding to emails... but I have a good excuse (http://home.swbell.net/zclobes/).

That out of the way, we still have several items up for discussion:

PRESENTATIONS:
The following is the list of possible presentations/presenters. I'm open to suggestions as to how many presentations we have, how long they last, and who presents.

- Mark Caviezel, ES-OS, Zero pressure balloons

- Tony Barrett, Sub 3-ounce tracking system

- Bill, WB8ELK, PeaceStar

- Paul Verhage, Cosmic Rays

- Mike Manes, EOSS, Tracking -OR- FAA reporting -OR- Alliances with Space Grant Colleges -OR- national balloon organization

TIME SLOTTING/FREQUENCY ALLOCATIONS:
I've put together a rough outline of a definition of time-slotting at http://www.rckara.org/project_traveler/gpsl/time_slot.asp. I don't have any experience with the MIM modules or KPC-3+ config so if someone else would be willing to write a paragraph or two outlining the proper configuration, I'll post it to the site ASAP.

We currently have approximately 7 balloons anticipating using 144.3xMHz for APRS position reporting. Dividing a minute by 10 brings us to slots of 6 seconds each, once per minute.

I am not aware of any frequency congestion issues on 144.34MHz in the Hutchinson area, so I'd recommend using that unless someone feels strongly otherwise. I do have an I-Gate sitting in my basement available for use at GPSL - it can be changed to any 2m frequency.

LODGING:
It sounds like several people have been gravitating toward the Holiday Inn Express. I can't speak from personal experience, but I've never heard anything bad about the place and it's in a good location for the conference, food, easy to find, etc...

HELIUM:
I plan on calling tomorrow to confirm and, hopefully, get a firm price, but I've been told helium should be in the $45 per 240cu ft range.

LAUNCH SITES:
I have not made any contact with alternate launch sites at this point. I'm going to try calling the McPherson airport tomorrow to see if that would be an option. We also have an old military airbase about 15 miles S-SE of town that may be an option #3. I will try to post information soon with Lat/Lon and directions.

Let me know if there's anything I'm missing - it's going to be here before we know it!!!!!!!!!
Zack

671. Re: [GPSL] GPSL Preparations

Hi Zack

Hey, you've bitten off a Big Job, as mah dear besainted momma usta say. So if your feeling a bit overwhelmed, ask others to lend a hand, where it can be handled w/o being in Hutchinson.

Re the EOSS bit: Marty WA0GEH does a KILLER job on the EOSS T&R method that's creditted with our 76/76 recovery record over 13+ years. But he did that pitch at GPSL 2002, and even demoed it a bit going after the last of the 6 payloads that day. I can do any of the other bits, if cited interest leans that way in the next couple of weeks. The National Balloon Org idea is probably better suited as a round table discussion, since I have just a vague idea of how it would work - but I do suspect that ballonacy's getting big enough now to warrant some thought in that direction.

Re 144.3x time slotting: I think that a number of the groups are planning on using the 144.39 APRS backbone, which wouldn't QRM the 144.34 that a lot of us near urban areas have escaped to. I have no idea if the MIM can be slotted, but the KPC-3+ V8.3 can, as can the TinyTrak 3. In both cases, the slotting works best if intervals in sec are evenly divisible into 60. But 6 sec is a bit tight, especially if we want to try some EBBE on 144.34. 145.600 is another freq that's wide open around Denver, but 147.555 did bother the Skywarn folks near Manahattan; if that's gonna be a problem near Witchita, then I won't bother bringing our crossband payload; it's xtalled there and runs 100% duty.

Guess we need to get the various groups to start picking 2m APRS freqs and time slots. Recommend at least 10-sec intervals on each freq. Note also that some beacons can't be slotted, so those should probably occupy no more than 3 on a given freq, each with some non-integer fractional minute beacon rate to minimize QRM, eg, 52, 60 and 68 sec. I'll get the ball rolling on 144.34 with W5VSI-11 on 144.34 at slot :00 sec.

If the Hol Inn offers "convention" rates for an attractive discount, then that might be the best plan, Zack. Not sure how many of the nine EOSS members can pair up or how many are bringing XYLs. But put Rick N0KKZ and I each down for single, smoking rooms Thu, Fri and Sat for starters.

For the EOSS attendees: recommend you get on the GPSL yahoo-groups reflector. This will be the last time I re-post to the EOSS one.

Re He: EOSS will need about 1.5 K-bottles, and make sure they don't give you "balloon" He - it's cut with N2. Welding grade (99%) only.

Normally, EOSS brings a spare balloon and enough gas to fill 'em both, so it might be a good idea to have some extra on hand, if the supplier will refund untapped bottles. We'll pay you for each whole bottle we use on the spot, or would you need that $$$ in advance?

Also nice to have a bottle dolly, like a welding cart, on hand to help move the bottles out out each fill site.

Re launch site: that old airport sounds good - especially if we can get on a paved tarmac with vehicles. And it's probably well away from town, just in case there's a premature descent. Launching from an active airport can create headaches for pattern traffic.

From: n9xtn@cox.net
Topic: 673 Message: 673

Zack,

Let's make sure everyone is clear on our tank orders. Are we getting K or T tanks? Since I normally fly close to 12 lbs, I generally empty a T tank (290 cu ft). K tanks appear to contain about 220 cu ft.

If everyone is planning to use about 290 cu ft, it may make more sense to order 1 T-tank per flight, plus 1-2 spares if we can return unopened tanks.

Both sizes are available as follows:

K - 244cu ft runs $46 each
T - 291cu ft runs $60 each

They will allow us to return any unopened takes, so I will be sure to have a couple of spares on hand.

As for the quality (balloon vs. welding), it's coming from a welding supply shop. We've used them for the last two or three flights and our numbers match up very closely with WinLift's predictions.

We can "probably" borrow their cylinder dolly for the weekend if we ask really nice. I can probably produce another standard dolly or two also.

We do need to pay at the time of the pickup (Thursday or Friday). I will get payment details on the website soon.

Have arrangements been made for tank transport (pickup from store, transport to launch site, return to store)? Hopefully we can avoid having to rent a truck for this or having everyone do it themselves, especially since those of us from out of town will likely be leaving before Monday morning.

I might be able to carry a tank, but I'll need to leave after lunch on Saturday.

I've scheduled a visit to NSBF for July 6. Is anyone interested in going along?

Hi Mark & Zack,

Yeah, one T bottle will do for a full exempt load on a 1200 gram bag,
but it's sure a whole lot heavier to schlep around than a K bottle.
It's also less of a white-knuckle event to be able to see a fill
complete while there's still plenty of flow from the bottle!
If we have a bottle dolly and hard surface to run it on, then either
will do - the suppliers charge by SCF, I think.

Within a penny per CF - not a major issue. But if we need to crack
a T bottle to complete a fill, due to a leaky fill rig, e.g., that
counts for the price of a nice lunch!
>

OK - didn't intend to insult anyone's intelligence, but that did
happen to one of our groups a while back. Emptied both K bottles
into a 1200 gm and still way shy on excess lift despite a VERY large
bag!

> We can "probably" borrow their cylinder dolly for the weekend if we ask
> really nice. I can probably produce another standard dolly or two > also.

Yeah - a regular dolly with stout rope or chains works fine.

Hi Zack,

We learned the hard way at GPSL 2003 that a non-commercial truck
is permitted to carry no more than 7 compressed gas cylinders. Not
sure if that's a Colo or Fed rule, but might be good to check with the
gas supplier.

Hi Mike,

Shux, bring a balloon, too! More the merrier - there are already
nine, count 'em, on the docket, so one more won't bust the bank.
Helium will be on site if you buy it from Zack, and you can borrow
a fill rig if you don't have one already.

Recommend you get on the GPSL yahoo-groups reflector as well. That's
where we're posting to all the attending groups.

My 2.75-cents (energy costs are increasing rapidly):

Every high altitude balloon program and mission that I have heard of has used Amateur Radio links for TT&C (Tracking, Telemetry and Command). A very high percentage of individuals involved in high altitude ballooning are active in other aspects of Amateur Radio. Some of us have been active in several aspects of Amateur Radio for many decades.

Based on these arguments and my personal twist I suggest we call this stuff, "Amateur Radio High Altitude Ballooning". Paul likes the phrase, "amateur near space", which could be changed to, "Amateur Radio Near Space".

"Amateur Radio" should be capitalized.

"An amateur radio license is not required to participate." could be changed to, "An Amateur Radio license is not required to participate but Amateur Radio links are used for all tracking, telemetry and command links and payload recovery coordination.

Hi Zack,

Good idea. By that time, we should have a pretty good handle on the forecast trajectory so we can plan a launch site that won't land us downtown somewhere. BTW, who's on tap to run the forecast? Rick N0KKZ did that at the '02 GPSL, but he'll need an I'net access point.

Any news re possible group discount rooms in Hutchinson? The EOSS contingent is now at 9 members + some XYL's.

And what's the gouge on tickets, hours, etc at the CosmoDrome (sic?); some of our group would like to visit there Sat PM or Sun AM.

I've called Holiday Inn Express regarding a group discount, but the manager is out until Tuesday. I will try back then.

So far, I think everyone has been migrating toward the Holiday Inn - just guessing but it's probably best bang for the buck.

694. GPSL Update

Yahoo group: GPSL (2002 — 2008)
Date: 2004-06-01 02:26:53 UTC
From: Zack Clobes
Topic: 694 Message: 694

I've made some semi-significant modifications to the Itinerary. Please review these ASAP.

To sum up the changes, I've moved all presentations to 1 hour (preferably slightly less so that we can have time to stretch) in length since there wasn't much discussion as to who should get cut. Per Mark's request, I've also left the afternoon open for any groups that wish to come forward and outline their happenings.

http://www.rckara.org/project_traveler/gpsl/itenerary.asp

IF YOU ARE SIGNED UP AS A PRESENTER, PLEASE CONTACT ME ASAP WITH THE FOLLOWING INFORMATION:
1. Your full name as you want to be introduced and posted on the website.
2. Your callsign.
3. Your group's callsign - the one you normally fly.
4. Your group.
5. Your hometown
6. A one paragraph (or so) outline of what you will be talking about for me to put on the website/schedule.
7. What specific tools you will need to give the presentation (projectors, computers, software, laptops, VCR's, DVD's, etc, etc ,etc)
8. A time estimate of when you will have your presentation prepared and submitted to myself. I need all presentations at least a week ahead of time to have them available on the projector's computer.

695. Helium order form

From: Zack Clobes
Topic: 695 Message: 695

There is now a helium order form on the GPSL website. Please complete the form and return to me with a check for the gas.

Topic: 691 Message: 696

I think this is a great idea and have added it to the itinerary. It's
at the end of the day, so we can be somewhat flexible in terms of timing.

As I understand it, it's a pretty nice and modern room. They have all
of the standard power point, VCR, DVD, web, etc. Apparently, they also
have a video camera hooked to the projector to facilitate showing of
small objects, printed materials, etc.

Is anyone looking to split a room? I figure we can save by splitting the cost of a double.

700. Time Slotting

Yahoo group: GPSL (2002 — 2008)
Date: 2004-06-02 01:36:47 UTC
From: Zack Clobes
Topic: 700 Message: 700

I've assigned time slots to all of the payloads planning on operating on 144.34MHz (with the exception of Paul). Any packages that are not configurable as outlined should be moved to 144.39MHz.

Each payload has a full 10 seconds of time to transmit its data which should be more than enough to fit as many as 8-10 packets per minute.

Any thoughts on the chase frequencies? Pete used 146.49 yesterday with success. As far as I'm concerned, we could also move to 440MHz. Will all of the chase teams have 440 equipment with them?

701. Base station for GPSL?

Yahoo group: GPSL (2002 — 2008)
Date: 2004-06-02 01:47:19 UTC
From: Zack Clobes
Topic: 701 Message: 701

I have arrangements made with the Cosmosphere to have a station in the lobby area for tracking. The building doesn't open until 9:00am be we can have it setup on Friday evening.

QUESTION: Do we want this base station?

Is there anyone willing to stay behind and run this? I think I can come up with a piece of tower and some antennas. I may even be able to come up with an APRS setup, a computer, and Internet access (No promises on these).

But it comes back to, does anyone want this and will anyone be willing to man it?

Zack

702. Re: [GPSL] Time Slotting

Yahoo group: GPSL (2002 — 2008)

From: Mark Conner
Topic: 700 Message: 702

I would definitely suggest 70cm for a chase freq. TXing 2-3 MHz up at 146 or 147 MHz will desense data reception of 144.3x.

- Mark

Zack,

Are we still planning to get a couple of "extra" tanks in case we have a burst, and that we can pay for those at the time if needed?

Also, for the group as a whole - anyone had problems ordering balloons (out of stock, etc.) from either Kaysam or Kaymont? I've heard some discussion to that effect, but no details. I need to order from one place or the other this month.

Hi Zack,

I think 10-sec slots would be OK, but it'll only accomodate 6 beacons.
It might not be bad to go to 2-minute beacon intervals if we end up
with over 6 tho. It's important that the slots (in seconds) be evenly
divisble into 60 to ensure a quick sync-up of TT3 beacons.

Slotting the KPC-3+ is a bit dicier, since you must specify a START
time which must be after the GPS syncs up but before launch. This
can be programmed after the payload is buttoned up thru the remote
sysop mode or via the serial port.

I don't think the KPC-3+ is that picky. If you want a beacon
every minute at 20 seconds past the minute, you just specify

BLT n EVERY 00:01:00 START 00:00:20

I used to do something similar when I ran a 3+ in my car for a
tracker - worked fine after power was cycled with or without GPS.

I'd rather stick to 1 beacon per minute if at all possible, and
reduce the allowed interval.

I know that I personally would rather not go to two minute intervals - that's a long time not to hear from your investment.. :-)

As far as the timing, we could easily go to six second slots to give us 10 which should be more than enough. The only problem that I see with that is if you avoid the first and last second, that only gives you four seconds to get everything out the door.

Are there any repeaters out thataway which could be pressed into service for GPSL? Even if we all stay inside simplex range, the repeater would yield some nice PR for ballooning in the local ham community. It's a good idea to get the trustee's OK in advance, however.

One other note to keep in mind. Are you time slotting based on GPS or UTC time? UTC is corrected for leap seconds. As of June 2, 2004, it is 13 seconds behind GPS time.

Hi everyone, I finally turned in my vacation request yesterday to attend GPSL 2004. I requested time off for Friday too. IF it is approved I should be there.

I plan to launch on Saturday either way.

I can time slot.

I'll get my payload worked out and get forms filled out as soon as I can.

Hi Mike,

The TT3 real time is drawn from the hhmmss field of the GPS NMEA
sentence. My KPC-3 is set up to sync its DAYtime value with the
$GPRMC hhmmss and date strings. So I guess we're looking at GPS
time vice UTC.

Yes, units typically default to UTC. Most held units have it is as option
buried somewhere in their menus.

When cold starting a GPS engine, it won't have the UTC correction factor
and it may take up to 12 minutes to get the value. The UTC correction is
one of the sub-frames in the Almanac data stream.

Hi Mark,

Having pored over the dox for the Rockwell Jupiter that EOSS uses,
I see the distinction between GPS and UTC. In fact the hhmmss field
in the NMEA is UTC; GPS time is expressed as a single (large!) integer
value in seconds since the "epoch". I've checked the reported NMEA
times against my WWVL clock, and they match to the second.

I've had the same experience with my Garmin GPS-35 - it matches my wall clock and WWV.

722. Re: Balloon Experiments and Endeavors

Yahoo group: GPSL (2002 — 2008)
Date: 2004-06-08 21:08:54 UTC
From: Mike Manes
Topic: 722 Message: 722

Hi Pat,

I'd be delighted to chat with you about our little balloon group out here in Colorado, Edge of Space Sciences, and invite to browse thru our web site, www.eoss.org at your leisure. I'm (semi) retired and you can reach me darn near nay time via email or landline at 303-979-4899.

EOSS has been actively supporting NASA Space Grant Consortium balloon-borne experiments for colleges since 2000, thru the good graces of Chris Koehler, interim director of the Colorado Space Grant Consortium. I've cc'ed him on this reply.

There's another amateur balloon group in the DC area, the Loudin County (VA) ARC (?) which has flown a few times in the past couple of years. Ralph Wallio W0RPK, cc'ed above, no doubt can get you contact info.

And there's also a convocation of at least ten balloon groups gathering in Hutchinson KS 2-5 July 04 for a conference and mass launch; it's the 4th Great Plains Super Launch (GPSL '04), and there's a link to the GPSL web site on the eoss.org home page.

Finally, the grandaddy of all this this balloonacy stuff, in the US anyway, is Bill Brown WB8ELK, also cc'ed, who works for NASA out of Redstone Arsenal, I think. Bill's planning on being at GPSL.

Unmanned ballooning from the east coast does present some interesting recovery challenges not avaliable to us who land in the wide-open spaces of the Colorado eastern plains. I think you'll find the challenge most interesting!

723. Conference Rates at the Hotels

Yahoo group: GPSL (2002 — 2008)
Date: 2004-06-10 22:33:14 UTC
From: Zack Clobes
Topic: 723 Message: 723

I finally got the lady with Holiday Inn/Microtel to call me back. Short answer is no, they don't have any special rates available. Apparently there are some other groups in town over the weekend and they are nearing capacity. She indicated that they had about 10 rooms left in each hotel.

I think you could save a few bucks by taking the Super 8 just down the road, however as of a few months ago, they didn't have high-speed Internet available.

Zack

724. Presentations

Topic: 727 Message: 728

I will try to get a frequency coordination page posted to the website.

At this point, I'm figuring on the following frequencies:
Local repeater: 147.12+ -- Good within Hutch plus 15 miles
Long range repeater: 146.82- -- Good within Hutch plus 60 miles (this repeater is owned by the Wichita club, and we will be using this as a secondary repeater)
Simplex Frequency on chase: 146.49 -- All chase communication on Saturday <--- we may want to go 440MHz if available
APRS data: 144.34 -- Only for time-slotted transmitters

The TinyTrak III can indeed do time slotting. HABITAT will be flying a Pocket Tracker using a TinyTrak III chip.

I should probably add that the TinyTrak can only timeslot in 1-minute intervals. A previous post suggested 2-minute intervals; I suggest if we fill up all 10-second intervals we go with a shorter interval, such as 8 seconds, keeping in mind we need "guard" timeslots to keep from stomping on each other.

From: Mark Conner
Topic: 735 Message: 735

The GFS forecasts now extend into the GPSL period (hard to believe that's only two weeks from today). At the moment, things look to be fairly normal for early July. No major storm systems are expected to move through, however, consistent southerly winds will bring a lot of moisture from the Gulf. At this point I would expect conditions similar to the 2002 GPSL, with afternoon temps in the high 80s, thunderstorms possible in the afternoon, and relatively light winds from the south.

Upper-level wind forecasts are all over the place, indicating landings to the north, east, or south. Probably less than a 30-mile trip.

I noticed that we have capsule prep starting at 0730 for an 0845 launch. Do we want to move that about an hour earlier? We could gauge that the day before to see if there will be wind problems, but as everyone knows the closer to sunrise the better the winds usually are.

Hi Mark,

In general, you are right re dawn winds. However, in the past couple of months, we've encountered minimum winds closer to noon; both were in the wake of a frontal passage. Perhaps we should play that by ear, as with GPSL 02, when we moved the launch site 50 miles Friday PM to avoid landing in Ft. Riley.

I chose the later times primary for logistical reasons - I believe it would take an act of God to get eight balloon groups ready to launch much earlier than 9:00am.

Personally, we (Project: Traveler) haven't found much value in getting up early. The earlier you get up, the more people who are running late. Also, we haven't noticed drastic changes in winds between 7am and 10am. If it's going to be windy at 10, it's likely to be windy at 7.

And finally, I originally put that together with the thought that someone would be monitoring from the Cosmosphere, which doesn't open until 9:00am. Unfortunately, I haven't had any firm takers on that position so it looks like that's a moot point.

Anyway, that's my reasonings. I'm totally flexible - we can launch at 5:00am as far as I'm concerned.

Discussion?

Zack

My vote is to keep the schedule the way it is for the same logistics reasons
that Zack pointed out....around these parts the winds are usually good until
past 10 or 11 am, if they're good at 7am...although I tend to launch around
noon a lot (I've gotten pretty good at high wind takeoffs as a
result)....basically because I'm not much of a morning person and don't like to launch
balloons
while still half asleep.

Hi K-Mark,

The next "non-heavy" flights I see on the docket so far are
EOSS-80 at GPSL 04 (thought you were gonna be flying a
plastic there?) and the JOTA flight in Oct. There MIGHT be some
spare payload budget on the heavies, but we won't know for sure
until maybe a week in advance.

742. Logo and GPSL Motto

Yahoo group: GPSL (2002 — 2008)
Date: 2004-06-21 19:50:11 UTC
From: paul.verhage@boiseschools.org
Topic: 742 Message: 742
Attachments: 2 described; binary payloads are missing from this source WARC

I've updated the logo based on input from viewers. Here's the new near space logo in pdf form, which seems to be better quality then a gif. Please fell free to use it.

I'm also proposing a motto for this GPSL. How does, "Will chase balloons for food" sound?

I plan to bring a t-shirt with that.

Get your presentations together, you have just over a week. And please have some written text that I could put together into a conference report. I'd like to make graphs, photos, and text available on CD for everyone. A slide presentation isn't as helpful as text.

Remember, there are two prizes this year. One for the highest flight and the other for the most accurate landing prediction. Ralph, can you help out with that? To keep the work managable, there will be one prediction per launch team and it's just for your launch. This way we should be able to determine the winners and award the prizes during launch.

Please feel free to make suggestions. And above all, have a good time!

Paul

743. GPSL Organization?

I'm not sure we need a GPSL organization. The "membership" tends to drift depending on the location that year. I do see a need for some kind of national organization, if for no other reason than to coordinate and share resources and experience.

www.gpsl.{com,org,net} seem to be taken already. www.superlaunch.org is available. I think a permanent web site would be nice.

As a reference point, nstar.org costs about $60/yr for name registration and server costs (which includes 300 Mbytes of space, mail forwarding, full MS FrontPage compatibility, etc). We could probably get by with less space to cut costs if needed, and perhaps someone can come up with a free or nearly free solution.

From: Zack Clobes
Topic: 745 Message: 745

I need to get a rough head count for scheduling, parking, and eating considerations. Please send me (zack@...) an email indicating:
1. The names of your party.
2. How many vehicles you will have for the chase.
3. Whether or not you will be attending the conference on Friday.

This information would be greatly appreciated.

Thanks,
Zack

Hi Paul,

I think that there are enough active balloon groups in the country
now that it might be worth setting up a national (or international?)
amateur ballooning organization along the lines of the ARRL. It could
offer us a common forum for discussion of ideas, purchasing power, a
real periodical and might even have enough ooomph to interest
underwriters to offer affordable liability insurance.

How about round table discussion at the GPSL '04 conference, Zack?

Hi Lloyd,

Sure, long distance balloning has been done for a LOOOOONG time; just not using latex (with a few sad exceptions). Recall that just a few years ago, the earth was circumnavigated non-stop in a manned hybrid helium/hot air balloon. It turns out that one of the Japanese ballons actually landed just a few miles from EOSS's winter launch site near Ft Collins CO. And we've been working with NOAA Forecast Systems Lab in Boulder on the GAINS 6-mo duration balloon project.

But your question is germane: recovery becomes tedious, and if the balloon gets into civil airspace, or over Libya or China, it becomes even dicier.

If we had our druthers, there would be no such thing as wind. Just pop it off and wait for it to land in your lap. O'course, w/o wind, there'd be no weather and no atmospheric energy exchange, so life as we know it wouldn't be here ...

BTW, do you plan to join the Great Plains Super Launch in Hutchinson KS over the 4 July weekend? There'll be at least 10 balloon groups there.

Hi Zack,

At last count, EOSS has the following gang coming; all of 'em except
XYLs plan to attend the Friday conference & chase Sat.

Grouped by vehicles:

Mike W5VSI & Rick N0KKZ
Marty WA0GEH + XYL
Larry K0ANI + XYL
Larry N0NDM & Chris KB0YRZ
Russ KB0TVJ + XYL?
Nick N0LP + Michelle (staying in Wichita)
Benjie W0CBH & Marcia KC0SOW

So unless I missed someone, that's 14 total in 7 vehicles, with 9 heads
for sure at the conference, and all 14 bellies at group dinners.

EOSS GPSL folks: pls post any corrections as Reply All.

And, do not forget to supply Amateur Television Quarterly as soon as possible with information about the GPSL event!

I will be working on the Summer 2004 issue while the event is happening, and if you would like coverage, I will need information and
pictures as soon as possible after the event. It goes to the printer July 15th, but if it is to be included, I need time to work it
in.

Would someone like to be the contact person for ATVQ?

Someone want to write an article to recap the event?

Have fun. I wish I could be there.

751. Photos at GPSL

Yahoo group: GPSL (2002 — 2008)
Date: 2004-06-22 19:26:51 UTC
From: n9xtn@cox.net
Topic: 751 Message: 751

If at all possible, please have a photo CD made with any film photos you take at the GPSL. This includes payload cameras. I would like to collect a complete photo record of this year's events - if it's all digital, we can make copies cheap. At Wal-Mart, this costs less than $4/roll.

If you shoot digital photos, be sure to archive them somewhere.

This might be a stand-alone effort, or could go with Paul's efforts to collect presentations. There's 700 Mbytes on a CD - let's fill it up!

Just mail me a copy of your photos on CD to my callbook address, or if you have FTP space somewhere let me know and I'll download them.

This will go a long ways towards creation of a future GPSL website too.

756. EOSS Scheduled flight info

Yahoo group: GPSL (2002 — 2008)
Date: 2004-06-23 11:52:05 UTC
From: Mike Manes
Topic: 756 Message: 756

Hi Zack,

Just got off the GPSL web site - Here's the info to replace the
??? for the EOSS lauch:

Title: "EOSS-80" vice "W5VSI-11"

Primary Contact: (me) .... from Littleton, CO (w5vsi@...)

Website: www.eoss.org

Repeater: NONE - we've decided not to tie up so many freqs

ATV: EOSS de-spun look-down camera, switching to a look-up camera
above 50,000 ft. Cycle during ascent to 50K', 2 min lookdown,
1 min look up, 2 min QRT.
XMTR: KPA-5, ANT: W6OAL/W5VSI robust Little Wheel.

Ballon/gas: 1200 or 1500 latex, approx 300 CF He

Est'd burst: 90 - 100K'

Est'd ascent rate: 1000 - 1100 FPM

Est'd descent rate: 1200 FPM @ SL

Capsule weight: ATV - 4.5 lb; APRS - 2.4 lb; DF/cutdown - 1.1 lb;
Total payload: 8.0 lb + flight system: 1.5 lb = 9.5 lb neck load

APRS Telemetry data: W5VSI-11 - GGA @ 60 sec, RMC @ 120 sec, KPC-3+
analog telemetry at 300 sec. Node: BALNOD; Digi: EOSS; BBS: BALBOX.
Slotted to start @ 0:00 each minute w/ active DCD collision avoidance.

BTW, it's doubtful that we'll have the commandable valvedown ready to
go for GPSL; if we get lucky, we'll fire it at 80,000 ft.

758. Forecast for next Fri/Sat

Yahoo group: GPSL (2002 — 2008)
Date: 2004-06-23 20:30:46 UTC
From: n9xtn@cox.net
Topic: 758 Message: 758

Still looks pretty good. We should be in a situation where we don't have strong winds just above a surface inversion, so a ~9am launch should be OK. Morning temps will be about 70 and afternoon highs near 90. It will probably be humid, with afternoon showers and thunderstorms possible. However, no major systems are expected to pass through to produce sustained areas of rain, wind, or severe weather.

The upper-level wind forecasts still have a lot of variance. The strongest winds aloft are forecast near 38,000 ft from the southwest about 30 kts. At the high altitudes (above 80,000 ft) the winds should strenghten from the east at about 30 kts. So burst altitude will be key to your landing forecasts - higher bursts will push the landing west about a half mile per 1000 ft. The terminal part of the chase should be easy with winds less than 15 mph below 15,000 ft.

Date: 2004-06-24 16:24:18 UTC
From: n9xtn@cox.net
Topic: 759 Message: 759

Has a repeater for Thursday/Friday use been chosen for GPSL? I can't get the message archives from here, so maybe this has already been discussed. If it has been chosen, can it be put on the website for future reference? 2m is fine, but perhaps a 70cm repeater would have less use.

Also, if there's a wide-area 70cm repeater for the chase on Saturday, that might be useful. I imagine we'll be close enough for simplex work most of the time.

761. "ES-OS" pull out from this year's GPSL

Yahoo group: GPSL (2002 — 2008)
Date: 2004-06-25 18:00:06 UTC
From: K. Mark Caviezel
Topic: 761 Message: 761

Comrades in Balloonacy:

It's very unfortunate that "ES-OS" will have to cancel attendance at this year's GPSL. I have recently emerging professional obligations that will preclude my attendance, and other "ES-OSians". Hopefully I can get it together for next year. The planned 1/2 million cubic foot 'baby-shamu' zero pressure balloon is as now still-born as I have been unable to get suitable balloon film at an affordable (to me) price.

- KMC ac0ak Denver, CO.

From: Zack Clobes
Topic: 763 Message: 763

So what was the consensus of the group? Was it a 7:30am launch, or an 8:45am launch?

The Cosmosphere station is officially dead, so that's no longer a factor.

Zack, several of our group will be joining us the morning of the launch. I just need to let them know when they should be there. Driving down from here means leaving KC metro at 'Zero Dark UGLY'. ;-)

Several of us should be there Friday. But as you know I don't do mornings well. ;-)

Looking forward to it.

Hi Zack,

Provided the launch site wind forecast is good, the later, the better.

Coordinating the prep and fill of nine or so balloons and flight strings for a simultaneous launch is gonna consume time. So I'd recommend planning to set up at least 2 hours in advance.

Is there any reason we can't nail the launch time Friday afternoon when we have a confident forecast?

From: dirgebig
Topic: 768 Message: 768

I was wondering if anyone has the contact point for ORB? I am a grad student at OSU and we are looking at starting up a balloon sat program and would like to get help from some of the local area clubs in the tracking and recovery phases. If you know of someone in the area of Stillwater that is willing to help, please have them contact me.

Thnks

Well, this is the final count-down for the "Big" balloon launch. People are to begin arriving in town on Thursday to attend the conference on Friday. Saturday morning is the planned balloon launch - the exact location is yet to be determined and will be announced on Friday. The primary talk-in frequency will be 147.12+. Other local repeaters are on listed on the GPSL website under "Getting to Hutchinson".

Per the discussion on the GPSL group, plan on showing up at the launch site BEFORE 7:30am. That means 7:30am, not 7:31, or 7:32, or 7:40. We will launch as soon as everyone is ready, but NO LATER THAN 8:45am. In Kansas, 30kt sustained winds are considered "normal" and I think most would agree that we don't want to test mother nature.

Any groups that are running late should expect to have one knuckle removed from their hands for each minute past 7:30am.

The chase teams should plan on using either 146.49MHz or 446.000MHz simplex, as they see fit. I realize that this is going to be a disconnect for the group, but I have a feeling that one frequency could get a little congested.

For more information, be sure to watch the GPSL website at http://www.rckara.org/project_traveler/gpsl/

From: Mike Manes
Topic: 770 Message: 770
Attachments: 1 described; binary payloads are missing from this source WARC

Hi,

The revised EOSS-80 GPSL payload plan is attached as a Word97 .doc.
I've dropped the crossband repeater to mitigate freq usage & the dump
valve since it won't be ready (I'll have a prototype for a 3000 gm bag
for show & tell Friday) and cut back to a 1200 gm balloon.

Hi again, Joe

Try going to www.arrl.org and searching for ARRL affiliated amateur radio clubs in the Stillwater area. Or try googling to "amateur radio" or "ham radio" and "Stillwater". Many ham clubs have web sites. Have you looked for a ham club at OSU? They're usually associated with the engineering or physics depts.

773. GPSL frequencies/modes/time-slotting (please check and correct)

Yahoo group: GPSL (2002 — 2008)
Date: 2004-06-28 13:12:41 UTC
From: Ralph Wallio, W0RPK
Topic: 773 Message: 773

Perhaps it is time to distribute frequency/mode information gleaned from http://www.rckara.org/project_traveler/gpsl/scheduled_flights.asp and email discussion to a wider audience. Please double-check for accuracy and correct/add/delete as necessary. I will forward a corrected version to others on Wednesday.

144.310 WB8ELK MCW DF beacon downlink
144.340 APRS/telemetry downlinks from all flights (schedule below)
144.390 APRS/telemetry downlinks from NSTAR, KD4STH and TRAVELER
145.600 EOSS CW DF beacon downlink
147.555 EOSS FM repeater downlink
147.585 SSTV FM downlinks from HABITAT and NSTAR

426.250 EOSS AM ATV downlink (horizontal)
434.020 HABITAT DF beacon downlink
439.250 WB8ELK AM ATV (horizontal?)
441.025 HABITAT APRS/telemetry downlink
445.975 EOSS FM repeater uplink

APRS/telemetry downlink transmission schedule on 144.34MHz:
(Time-slotted from the start of each GPS minute)
00-09sec EOSS (W5VSI-11)
10-19sec Not assigned
20-29sec HABITAT (KA0JLF-11)
30-39sec NSTAR (N9XTN-11)
40-49sec TRAVELER (W0WR-11)
50-59sec WB8ELK (WB8ELK-11)
Once/min not time-slotted KD4STH (KD4STH-11)

Digipeating on 144.340 simplex uplink/downlink
Digipeating attempts limited to 10-19sec time-slot(?)
EOSS W5VSI-11 alias EOSS and BALNOD
NSTAR N9XTN-11 alias NSTAR

To all intersted parties.

This grant information just came across my desk. I am sure it would be of interest to all the teachers in the group and those of you who interface with science teachers. I believe this grant would fit nicely with with our hobby. Please pass this information alone as quickly as possible.

Grant Announcement:
National Weather Association Sol Hirsch Teacher Grants
Deadline: August 1, 2003
Funds available: Five awards of $500 each
Eligibility: Teachers of grades K-12
Areas of awards: use the funds to take an accredited course in atmospheric sciences, attend a relevant workshop or conference or purchase scientific materials or equipment for the classroom
Contact Information: NWA Education Committee, P.O. Box 15011 Baltimore, MD 21282-5011 (434) 296-9966; e-mail: NatWeaAsoc@...; web site: www.nwas.org/solhirsch.html

776. Weekend forecast

Yahoo group: GPSL (2002 — 2008)
Date: 2004-06-28 19:48:39 UTC
From: n9xtn@cox.net
Topic: 776 Message: 776

There is increasing uncertainty in the forecast for late this week. A weak cold front is expected to pass through Friday, but may stall near or south of Hutchinson for Saturday. This will increase our rain chances somewhat. Also, the low pressure area that is pushing the front south is moving out more slowly with each model run. If this trend continues, that would increase our surface winds for Saturday. Right now, the winds should be 10 kts or less.

This trend also affects the upper-level wind pattern. Previously the winds were more westerly and lighter, but now the forecast is turning more to the northwest and has more variation. This would take our landings uncomfortably close to Wichita. I'll run some data through Balloon Track when I get home this evening to refine this a little. Using the McPherson airport should be fine under these conditions, with the landings near or east of Newton.

Date: 2004-06-28 21:02:02 UTC
From: Zack Clobes
Topic: 777 Message: 777

By now, I should have everyone's helium order in. As it stands now, I'm ordering the following:

Paul - 2T
NSTAR - 1T
Project: Traveler - 1K
EOSS - 2K
HABITAT - 1K
WB8ELK - 1T

I'm also ordering one spare K and one spare T to have on hand.

If there are any changes or corrections, let me know NOW as I will be picking the gas up on Thursday morning.

Zack

780. Re: [GPSL] GPSL frequencies/modes/time-slotting (please check and correct)

Yahoo group: GPSL (2002 — 2008)
Date: 2004-06-29 01:07:01 UTC
From: Mike Manes
Topic: 773 Message: 780

Thanks for that, Ralph,

EOSS won't be flying the crossband repeater this year, so you may
free up 147.555 and 445.975. And our DF beacon on 145.600 is also
a command uplink - plus avoid xmitting there!

A note on the EOSS ATV operating cycle: During ascent to 50K', the
despun downlooknig camera is selected for 2 minutes, then the
uplook camera is selected for 1 minute; then the the xmtr goes QRT for
2 minutes. This 5-minute cycle repeats until we hit 50K', then we
go 100% duty uplook until decent back thru 50K', when we switch to the
despun downlook 100%.

Connecting to BALNOD on 144.34 and issuing a J cmd will return a
listing of callsigns heard; then C (callsign) will init an ARQ node
link. This module abides CS/CD, so it won't QRM other beacons.

I think we can leave it at 0845 for now, but leave open the possibility of going earlier if the surface wind forecast suggests we do so.

The READY site is having data problems at the moment, but hopefully those will be resolved by noon or so. The forecasts are still varying quite a bit on how strong the winds will be between 20 kft and 60 kft, which affects whether we'll be able to use Sunflower or now.

Will we have internet access at the college on Friday? It would be nice to have a quick weather briefing before we break for the day.

Many of the hotels have free broadband. We will also have it available at the college on the projector.

I think it would be a good use of time for one of us to show the group how to download the GFS forecasts and run them through Balloon Track.

From: Mark Conner
Topic: 785 Message: 785

I can talk a little bit about the models and their use in Balloon Track. My "NSTAR highlights" period may be a little thin, as I haven't had time to put much together. Mostly it'll be video clips.

Anyway, the GPSL website reads:

2. From the Sounding drop-down list box, select either one of the GFS models depending on the forecasting range required (up to 384 hours), or select 'Aviation Model (AVN 191 km Global)' to get forecasts up to 84 hours in advance.

Here are my recommendations for model usage:

0-12 hours: RUC and Eta
12-84 hours: GFS 0-84 hr and Eta
84-180 hours: GFS 0-180 hr
192-384 hours: GFS 192-384 hr

The "AVN 191km" dataset is a degraded GFS product to support users who are not able to modify their software to read the new higher GFS grid resolutions.

The Eta has more levels and generally does better at resolving boundary-layer features in the lowest 2-3 km of the atmosphere, which is handy for surface wind forecasting. The GFS is often better at the positioning and intensity of jet streams, and has additional layers in the lower stratosphere (the Eta tops out at about 60 kft).

I ran a prediction today and got a result of about 160 degrees at 35 miles. That is safely west of Wichita, but it would only take a change of 20 degrees or so to put us too close.

Hi all!

I have returned to Tulsa after a 30 day, 6,000 mile
vacation. I will be leaving here Thursday morning
for Hutchinson and will be staying at the Holiday Inn
at 1601 Super Plaza. The phone there is 620-669-5200.

As it looks right now I will be driving my van with a
stand-alone tracker. I will be available to be someone's
driver, co-pilot or observer on the chase.

Hi Zack,

Got this from Mike Gray last Saturday -- guess ANSR's a no-show,
as well as Mark Caviezel/ES-OS.

Hi Paul,

If all goes as planned, EOSS will need only about 60-70 cu ft out
of its 2nd K bottle; but we'll also be filling a 100 gm pibal with
under 20 CF. You can have what's left over after we tie off.

790. Forecast for Friday and Saturday

Yahoo group: GPSL (2002 — 2008)
Date: 2004-06-30 21:04:35 UTC
From: n9xtn@cox.net
Topic: 790 Message: 790

Over the last 2-3 days there has been persistent shower and thunderstorm activity over south-central Kansas. This should begin to diminish on Friday and Saturday could be dry. If nothing else, the high pressure starting to move in late Friday should keep the showers confined to the afternoon.

There is still a lot of variation in the wind forecasts. I think the surface winds will be quiet enough to let us launch at 8:45am. At the moment, Sunflower should be OK as the forecast tracks will be to the south or southeast but not as far as Wichita. It's possible, though, that we'd have to use McPherson if the upper winds get a little stronger.

Morning temps should be about 70 at 8am and into the mid 80s by noon. It should be relatively humid, and with the recent rainfall you may need mud boots to go out in the fields. Should be a mix of sun and clouds.

I'll be heading to Hutchinson with my wife and daughter after lunch tomorrow and should arrive around 7pm. I'll give a shout on 147.12+ when I'm in range.

Anyone else having trouble reaching the rckara.org site this afternoon? I haven't been able to get on since about 1pm CDT - it worked earlier in the day.

792. RE: [GPSL] Forecast for Friday and Saturday

Yahoo group: GPSL (2002 — 2008)
Date: 2004-06-30 22:02:05 UTC
From: Rick von Glahn
Topic: 790 Message: 792

I've been doing forecasts too and I agree that if we get the expected winds AND the flights all make it to 90K+ feet we're ok, however, there is a substantial easterly wind component above 65K. If a balloon were to burst at 65K its touchdown is now in central Wichita.

Food for thought.

That prediction is based on the GFS 0-84 hr run at around 20 UTC today (6/30). I tried to do a prediction just now but wind data isn't coming through at READY.

And, the "http://www.rckara.org/project_traveler/gpsl/" site worked a few seconds ago.

From: Mark Conner
Topic: 790 Message: 793

The 18Z Eta run shows a landing near Cheney for at 90kft burst, but about 4 mi W of ICT if it bursts at 60-65 kft. The 12Z GFS is indeed closer to Wichita for a 90kft burst and if it burst at 60kft the landing would be just inside the I-235 loop on the northwest side of the city.

Blue Sky would work fairly well in this case, as the landings would be about 10 mi S or SE of Hutchinson (and not far from the reservior in some cases). McPherson would be better, but that's a half-hour earlier we'll have to get up Saturday. I think the final decision will have to be made Friday afternoon - there's just too much variation from one run to the next to make it now.

The rckara.org site is working for me now.

That's probably the fastest. If you come in on 50 through Newton, be careful out around Peabody. There's some construction out there and in the last week, something like 7 people have died in wrecks due to the construction.

802. New possible launch site

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-01 02:41:36 UTC
From: Zack Clobes
Topic: 802 Message: 802

Another option came up in a discussion tonight of using the Hutch airport. I won't be able to get authorization until tomorrow, but if it works out:
* We'd have unlimited hangar space
* We could deliver helium the night before and have it ready. We could also leave the bottles there after the launch.
* We would have access to telephones, AC mains, bathrooms, etc
* We could drive a few vehicles out on the ramp if necessary.
* It's in town.

The ?down? side is that it is a controlled airspace (Class D) with a control tower. On the other hand, I talk to them before every launch and they've always been very understanding and helpful.

Any thoughts?

Zack

Hi Mark,

Have you marked out the Class A airspace around Wichita airport and
the McConnell AFB A-683 resticted area as "no fly zones" for GPSL?

Hi Harry,

That's excellent! Those tools are not part of the normal EOSS
recovery kit (wot's a "limb"??).

The airspace around Wichita is actually class C (Class A is everywhere from FL180 to FL600). And, as I recall, the area around McConnell is simply an alert area because of the heavies going in an out of there. There are no gunnery ranges or restricted areas - in fact that side of town is quite rich in GA traffic coming off of Jabarra and ?Beech? Field.

As for avoiding populations, that's a nice thought but impossible. If a payload is destined to cause damage, it's going to cause as much damage to a farm house as it is in downtown Wichita.

I'm not advocating projecting a flight to land in downtown Wichita, all I'm saying is that this is a business of calculated risks. We run the risk of causing thousands of dollars in damages and even death the INSTANT we let go of the capsule. Besides, I'm not convinced that our predictions are good enough to be that picky. At best, PT has had +/- 2 miles, which is more than enough to be inside or outside of 95% of the towns in Kansas.

808. WB8ELK balloon status

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-01 08:41:32 UTC
From: wb8elk@aol.com
Topic: 808 Message: 808

Due to my insane work schedule this past month and particularly this week (17 hour work day yesterday), I won't be flying a balloon this year at GPSL since I have to fly to Kansas instead of drive.....however, I will bring my micro-beacon (audio voice ID with 30 milliwatt FM transmitter on 144.31 MHz). If someone wants to fly it along with their payload for Saturday's flights, let me know Friday at the symposium....it weighs about 3 ounces with a lithium 9 Volt. If someone has an extra Ultralife lithium 9 volt or can pick one up at Radio Shack, please bring it on Friday...otherwise hopefully the Hutchinson Radio Shack will have some....they were sold out at my local store.

See you all there,

- Bill WB8ELK

Bill Brown asked me to put together a short Power Point presentation on the ANSR HF-APRS hardware. The following is a link to the document:

http://www.kd7lmo.net/GPSL2004.ppt

Can someone copy the presentation to a USB Flash Drive or floppy disk for Bill to use at his Friday presentation.

I'm not sure if he will be able to check is e-mail before tomorrow morning and I will be out of e-mail range in the next hour.

815. Quick GPSL Update

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-04 02:04:31 UTC
From: Zack Clobes
Topic: 815 Message: 815

Just a quick update on GPSL...

For the most part, the event went just as planned. The conference was good and many shared some of the precious experience with the group.

Saturday's launch went smoothly from McPherson airport. A total of six payloads made it off the ground and five of which flew almost exactly as predicted. All (or at least almost all) payloads were recovered in a very timely manner - and that includes HABITAT, although I understand something got lost somewhere along the way. Don, feel free to explain.

Watch the RCKARA website for updates, photos, tracks, etc. There will also be write-ups in CQ-VHF and ATV Quarterly very soon. If any groups would like to send me log files, track maps, or photos, I will post them to the website, space permitting.

Thanks for everybody's help and participation..
Zack Clobes, W0ZC

Zack, not sure what was lost? I'm not sure how the balloons got away from us. ;-) Seemed like a bit of a surprised launch. Sorry we lost the other groups. We were hoping to find everyone for lunch. More info later.

Great job with GPSL 2004 (from what I was able to attend). Thanks for a fun time! Sorry we didn't get to spend more time with the other groups! I hope some of you got to meet our newest ham (not a new member he has been to GPSL 2001 and 2002 but 2004 as a licensed HAM!) Dean KC0SSI. We have another one working on his license too.

As some of you might have noted we have had about a 500 percent increase in members. I'm not sure of the final count of our group attending GPSL 2004 but I heard 15. Way to go people! Yellow shirts everywhere (and even a non-HABITAT shirt floating around ;-).

73 Don

Ralph, we flew two 1200 gr and a 300 gr combination, (total 2700 grams - almost 2 full T tanks) does that place anywhere on the records page? ;-)

I would like to put as much information and pictures as possible on to one CD for distribution. I'll send one copy free to each of the participating groups, and they can further copy it as they wish.

I'll have an FTP site set up in the near future where pictures can be uploaded. If you have pictures taken on film, getting a photo CD when you have it developed is an easy way to get digital copies of your pictures.

A big note of thanks to Zack W0ZC and Project Traveler for setting up this year's GPSL, and to the EOSS T&R members who headed south to help with the NSTAR payload recovery.

822. Project: Traveler 2004d flight TOMORROW!!

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-04 16:04:20 UTC
From: Zack Clobes
Topic: 822 Message: 822

As it turns out, we wound up with an extra tank of helium at a good cost, and, Jon and I want to use it!

I dug into the GPS-18 last night and found two minor issues with it on the ground. The main issue was that I had it time-slotted for an odd second (55 seconds or so), however, once the unit got a good GPS lock, it was only outputting posits every 2 seconds, which happen to be on the even seconds. Therefore, it never found its slot.

So, in order to test this above 60k feet, Project: Traveler will be loading two small transmitters into a Kaysam 600g balloon with about 140cuft of helium.

I will try to get some predictions posted ASAP. We will plan on launching from the field east of the fairgrounds by 8:30am, weather permitting.

Zack Clobes, W0ZC
Project: Traveler

823. HELP!

Topic: 823 Message: 823

I'm trying to get the CQ-VHF article out the door by tomorrow. Can any of you fill in some details for me?

This was the ?FOURTH? GPSL?
2001 - ???
2002 - Manhattan/Herrington, KS
2003 - ?SOMEWHERE IN? Colorado
2004 - Hutch

?ALL? Payloads were recovered in their entirety? No significant damage to capsules or property?

A total of six APRS-equipped payloads:
W0WR-11 (Project: Traveler)
KD4STH-11 (Paul)
W5VSI-11 (EOSS)
N9XTN-11 (NSTAR)
KA0JLF-11 (HABITAT) - 3 balloons
KC5TRB-11 (Harry / Bill)

Any funny or interesting stories to include???

...more questions to come

Thanks,
Zack

824. FTP site for photo uploads

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-04 19:58:57 UTC
From: Mark Conner
Topic: 824 Message: 824

I've made an FTP site for uploading photos from this year's GPSL. FTP to n9xtn (dot) dyndns (dot) org. Your login ID will be your group name (EOSS, TRAVELER, ORB, HABITAT, IDAHO) and your password is the callsign and SSID you flew with your primary payload. All letters are caps, and the password includes the hyphen before the SSID. I didn't want to type everything out for fear of a password-harvesting program getting the information. If you have trouble with the FTP server let me know.

If anyone else not part of one of these groups would like to contribute pictures, e-mail me and I'll send you instructions.

Alternatively, you can e-mail me pictures at mark_conner (at) cox.net. You may be limited on file size and the mailbox limit.

825. First packet EBBE?

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-04 20:46:43 UTC
From: Mark Conner
Topic: 825 Message: 825

During the GPSL flights yesterday, N9XTN and W0RPK communicated by unproto packet messages through the NSTAR and EOSS TNCs. Below is the text from my log file:

W0RPK>EN31FK,EOSS*,NSTAR:QRZ via EBBE de W0RPK

W0RPK>EN31FK,EOSS,NSTAR*:QRZ via EBBE de W0RPK

N9XTN-9>APS212,NSTAR*,EOSS:Hi Ralph

N9XTN-9>APS212,NSTAR,EOSS*:Hi Ralph

W0RPK>EN31FK,EOSS*,NSTAR:TNX Mark via EBBE

W0RPK>EN31FK,EOSS,NSTAR*:TNX Mark via EBBE

N9XTN-9>APS212,NSTAR*,EOSS:Got it Ralph - tnx

N9XTN-9>APS212,NSTAR,EOSS*:Got it Ralph - tnx

Ralph's QTH is near Indianola IA at approximately N41° 26.2' W93° 34.0' N9XTN-9 was located at N38° 01.92' W97° 20.27' at the time of the QSO. The NSTAR payload was at N38° 01.79' W97° 11.17 and EOSS was at N38° 12.30' W97°17.72.

The distance between the QSO stations was 308.7 statute miles and the balloons were 13.5 statute miles apart. Ralph's QTH was 298.1 miles from the EOSS balloon and N9XTN-9 was 8.24 miles from the NSTAR balloon.

Yes, how much time do I have to get it to you. Tomorrow ok?

There was a unexpected launch of a handheld camcorder but quickly jettisoned by the capsule (I guess the mission commander, Glory - McDonald beanie baby, aborted that extra payload). Some damage to the shroud line ring, possibly from launch.

One of our earliest members (attended/assisted at GPSL 2001 and 2002) received his callsign KC0SSI issued 7/1/04 just in time for GPSL 2004. We have at least one additional member working on his license. This makes about 5 or 6 hams from our group. Something I personally am proud of. With lots more interest. We have increased in membership about 500% this year. Our pre-launch balloon nets on a local repeater is well attended, with remote stations checking in via web links. In addition, we had 5 members at GPSL 2001 (if memory serves me, I'll have to look at the photos again - nice thing about yellow shirts easy to spot - just

have to watch out for wrong color yellow ;-), We had at least 12, I think someone told me 15, at GPSL 2004.

> ...more questions to come

830. Great Time this last weekend.

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-05 03:57:56 UTC
From: Floyd Benjie Campbell
Topic: 830 Message: 830

Hi to all the gpsl attendees. I wanted to say that I had a great time this last weekend, attending the Friday presentations, and the Saturday flights. I really enjoyed the country and the friendly people that I have met. I want to thank the organizers of the event, you did a great job. I also want to say that I even enjoyed walking thru the very, very muddy cornfield in my stocking feet to help recover the EOSS balloon payload. The feel of the mud between my toes was great. When Paul showed us his boots during the Friday class room sessions, I thought, "Oh it can't be that bad!{" Well, it was, and I am a convert now, I will have a set of combat boots or rubber boots on my next flight. Thaks again for the fun and excitement. Benjie. W0CBH.

831. GPSL flights - a report from Iowa

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-05 11:43:42 UTC
From: Ralph Wallio, W0RPK
Topic: 831 Message: 831

I apologize for not being with you folks for GPSL-2004 but my dance card was full. I was able to finagle a few hours at home on Saturday morning to participate in telemetry reception and an EBBE QSO with N9XTN-9/m which Mark has discussed. Following are a few notes from my log:

14:48:24z KA0JLF-11 62,673ft 301.56-miles (1st packet rcvd)
14:50:07z KC5TRB-11 68,348ft 302.12-miles (1st packet rcvd)
14:51:54z W5VSI-11 56,135ft 297.79-miles (1st packet rcvd)
14:54z 1st successful digipeat via EOSS
15:01z EBBE QSO v EOSS, NSTAR with N9XTN-9
15:06:59z KD4STH-11 57,877ft 297.77-miles (1st packet rcvd)
15:31:31z N9XTN-11 51,785ft 294.24-miles (1st packet rcvd)

I continued to capture data but QSYed my attention to ANSR-20 which was launched at 16:00z with PSK-31 telemetry on 30, 20 and 17m. I copied frames on 30m and 20m but heard nothing on 17m (other stations report hearing 17m AOK). See http://www.kd7lmo.net/psk31.html for more information.

EOSS and TRAVELER were transmitting pure $GPGGA and $GPRMC GPS frames so I was able to plot their tracks with Street Atlas. It was interesting to watch their parallel westbound tracks before burst.

Our RECORDS page will be updated shortly (http://users.crosspaths.net/wallio/RECORDS.htm).

833. Project Traveler Monday Flight update

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-05 20:45:31 UTC
From: Jon Riley
Topic: 833 Message: 833

The flight was perfect.We were able to go above the 60k feet or 20k meters.

The primary pack had the W0WR-11 unit (vx-1r,7.4v Li-Ion batt. pack,Garmin 35lvc,and the controller)

The secondary that was the NEW hardware test had the AJ0NR-11 unit (radio shack HTX-200,7.4v Li-Ion batt.pack,Garmin 18 lvc,and the controller)

2 packs ,#3 3 oz total weight less balloon.
Burst about 78,520

Zack found the glitch in the 18lvc and got it working.100%

More info to follow.

Jon AJ0NR

834. GPSL Details ...

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-05 20:05:49 UTC
From: Mike Manes
Topic: 834 Message: 834

Hi Zack,

The 2003 GPSL was sponsored by EOSS, supported by Colorado Space Grant (whose payloads flew on some of the 6 GPSL flight strings), and we launched from the high school ball field at the S end of Deer Trail CO, just off I-70 50 mi E of Denver.

The actual landing site for EOSS's W5VSI-11 payload was just E of Hillside Rd between 1st and 12th St, E. of Newton KS. GPS location measured by the recovery crew was: 38d 02.950'N, 97d 17.654'W. The APRS module was on the deck between rows of 7 ft high corn, and had a rotten HDOP - so its reported lat/lon was about 150' or so off - in fact, it "wandered about" some in the hour between landing and recovery. Rick N0KKZ will have to get you his prediction and error range.

835. ARRL "Big Project": Opportunity for balloon groups?

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-05 04:32:23 UTC
From: Mike Manes
Topic: 835 Message: 835

Hi folks,

The League's "Big Project" aims to introduce ham radio to middle and secondary school students via "hands' on projects". This is the same tack that the NASA Space Grant Consortia take, as I presented last Friday at GPSL at HCC. If you draw a blank with your local Space Grant College, it might be worth offering a "balloonsat" program to your local middle or high schools under the Big Project. Kids seeing their creations soar towards the edge of space may be all it takes to bring them into the fold!

73 de Mike W5VSI
EOSS, an ARRL affiliated club

--- clip from ARRL letter Vol 23, No. 27 --- :=

=>ARRL SEEKS TO FUND NEW EDUCATION AND TECHNOLOGY PROGRAM INITIATIVES

The ARRL is seeking donations to equip ARRL Education and Technology Program (ETP) teachers to more effectively instruct students in wireless technology and to furnish them with activity kits that convey basic concepts. Instituted in 2001 as "The Big Project," the ETP now boasts nearly 100 participating schools, thanks to the generous support of ARRL members. In his travels around the US meeting with educators, Program Coordinator Mark Spencer, WA8SME, has learned that Amateur Radio as a catalyst for teaching wireless technology works best in an after-school setting. He's also has discovered that many teachers have been trained to
teach science but not wireless technology.

In a June appeal, ARRL CEO David Sumner, K1ZZ, explained that a lot of science teachers "are excited about what students can learn from Amateur Radio, but they are intimidated by this new world of wireless electronics.
They want to learn how to teach wireless communications."

ARRL Chief Development Officer Mary Hobart, K1MMH, puts it another way. "For some schools," she said, "it's a giant leap to go from zero to ham radio station."

The League has a two-pronged strategy to address the challenge. The first
is to debut a pilot ARRL Teachers Institute in August. The week-long seminar will immerse teachers in a curriculum that will have them studying
electronics, learning the basics of Amateur Radio and building projects. While generous donations have provided some funding for this initiative,

Hobart says the program still needs additional money to make the Teachers
Institute a reality. She hopes the ETP can find sufficient funding to keep
the institute and the program itself operating through 2005, "so the progress to date doesn't go to waste."

The second part of the plan is to provide participating teachers and schools with simple electronic activity kits that will give students hands-on experience as a stepping stone to deeper involvement in Amateur Radio and wireless technology. Each electronic project kit averages $350,
and more than 60 of them have gone out to 30 teachers and schools. Up until now, their cost has been subsidized by donations from the Newington
Amateur Radio League, the ARRL Foundation and individual donors. The project kits, Hobart says, have captured the imaginations of the students
and teachers alike.

"Next to defending our spectrum," she declared, "inspiring young people is
supremely important to the future of Amateur Radio."

Contributions can be made via the ARRL's secure donation Web site <https://www.arrl.org/forms/development/donations/education/index.html>. For more information, contact Mary Hobart, K1MMH, 860-594-0397.

837. Re: [EOSS] First packet EBBE?

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-05 19:18:40 UTC
From: Mike Manes
Topic: 837 Message: 837

Hi Mark,

Well, I guess congratulations are due, darnit! I tried twice to do an ARQ EBBE to N9XTN-9 but the link timed out due to the massive amount of traffic on 144.34. I guess EOSS's only consolation was the fact that the W5VSI-11/EOSS module was the first in the digi path from Ralph nearly 300 miles out; not too shabby for a 350 mw DJ-C1 into a 1/4 wave whip, huh?

BTW, it seems that Mark and Harry also did a UI EBBE, altho at a much closer range.

The next challenge will be to make an >>ARQ<< EBBE packet QSO ... We're on it ...

And I was gratified to see a 1023 fpm average ascent rate to 88,999.3 ft MSL reported from the on-board GGA log in the APRS module. Since our flight string was about 50 ft long and the APRS was at the bottom, I guess we can safely claim to have busted 89K'. Paul's 104K' was the kingmaker, however.

Another disappointment was loss of our ATV signal. Turned out that the BNC connector between the jack on the ATV module and the feedline simply came unscrewed during a rather traumatic launch - this despite the safety line to the BNC shell to prevent just that ... Murphy WILL have his way, won't he? Good news is that all three modules on the EOSS flight string came thru unscathed and remain fully functional.

Yet another great GPSL, and thanks to Zack and the rest of the team in making it happen. The EOSS guys are pumped to do it again in 2005 - if it's within a day's drive from Denver.

839. W5VSI APRS LT and raw 144.34 packet logs

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-05 13:26:34 UTC
From: Mike Manes
Topic: 839 Message: 839
Attachments: 1 described; binary payloads are missing from this source WARC

Hi Folks,

I've attached the GGA log from the W5VSI-11 APRS module and the raw 144.34 MHz packet log from the TNC in Rick N0KKZ's vehicle as zipped up text files. W5VSI-11 hit just shy of 89K' before burst.

And congratulations to Mark Conner for making two EBBE packet QSOs: one to Harry KC5TRB and then another with Ralph W0RKP, both via EOSS and NSTAR digis. My two attempts to work Mark EBBE timed out, tho.

The EOSS recovery from a muddy corn filed would have benefitted from the mucking boots that Paul got Friday, as pix on the EOSS web site will show shortly!

Great event, and looking forward to GPSL '05 - any takers?

Hi Ralph,

Well, congratulations on making the fisrt packet EBBE, altho I'm kinda
disappointed that my two attempts failed .... guess I shoulda had
the W5VSI-1 station in Rick's car beaconing from time to time. I
didn't notice your QSO with Mark until I perused the 144.34 log file
after returning to Denver.

It was nice to learn that the W5VSI-11 beacon made the path your way
at a lower altitude than the others. Coulda done it even lower had
I used the 3W radio and a J-pole! Note that I did have the BALBOX
PBBS running on that module -- coulda dropped me line ...

The next step will be a true ARQ packet QSO!

Mike,

I combed through your log file and do not find evidence of an EBBE QSO between Mark and Harry. Here is the closest detail I find (with bracketing timestamps):

W5VSI-11>APRS:
$GPGGA,145854,3812.3034,N,09717.7120,W,1,07,1.08,18886.4,M,-27.0,M,,*44

N9XTN-9>APS212,NSTAR*,EOSS:
KC5TRB-2 :Hi Harry{1q}

N9XTN-9>APS212,NSTAR,EOSS*:
KC5TRB-2 :Hi Harry{1q}

KC5TRB-2>APW247,K0ANI-14*,WIDE3-3:
:N9XTN-9 :ack1q}

WA0GEH-9>APS215,RELAY,WIDE3-3:
@040258z3757.34N/09719.10W>000/000/A=001424 EOSS80,Tracking Coordinator

N9XTN-9's APRS UI packet successfully transited NSTAR,EOSS but KC5TRB-2's APRS ACK via K0ANI-14 was not repeated by NSTAR. If anyone has a log file with the required EBBE evidence please forward it to me so Mark and Harry get credit they deserve.

I believe allowing UI-packet QSOs for records is very similar to the long-standing METSCAT protocol of repeatedly transmitting required information each way for up to 30sec of each minute until a QSO is complete (or the stations give up). The UI-packet method was first used for QSOs back in 1984 when Bob Carpenter, W3OTC, and I competed the first of several METSCAT QSOs on 6m between Des Moines and Washington D.C. areas and when Rich Zwirko, K1HTV/3, and I completed the first (maybe the only) METSCAT QSO on 2m also between Des Moines and Washington D.C. areas.

(As another proof of the advantage 6m has over 2m for METSCAT paths, Bob and I transferred 3k+bytes of data over a CONNECTED packet radio link -with ACKs- while Rich and I struggled to complete a minimal UI-packet QSO over a period of 2-1/2 hours during a meteor shower.)

Use of UI-packets for QSOs by savvy operators seems much more efficient than repeated connect attempts as well as repeated packet transmissions and ACKs. Data integrity resulting from connected state can be valuable but minimal QSO requirements are a very different animal. I propose we establish the standard and encourage use of UI-packets for QSO records.

Regarding the traffic load on 144.34, using the single channel for telemetry, digipeating, et. al., seems to work AOK when there is only one,

or maybe two, balloon(s) aloft at the same time. Telemetry from ~six balloons at GPSL with lots of digipeating from the multitude of chase vehicles creates a very different situation. Time-slotting of telemetry appears to become a moot point when there are as many digipeated packets (let alone failed digipeating attempts) as we repeatedly experience at GPSL. I heard numerous packet crashes so CSMA was not completely effective. I don't have an immediate comprehensive answer to the problem but will keep thinking.

TNX es 73 de Ralph W0RPK

I'll check my logs to see if the return ack from Harry went through both balloons. I guess the question is whether an automated response from a program should count as a QSO, or whether it should require manual input of a message.

There were several reasons for having many collisions on 144.34 last Saturday.

1) KD4STH-11 was beaconing much more than intended. I think there were 6-8 packets per minute from his payload.

2) Time slotting not fully implemented. I believe both KD4STH-11 and W0WR-11 were not slotted.

3) Deaf systems. AFAIK, only W5VSI-11 and N9XTN-11 actually listened on 144.34.

Any one or two of these issues would not cause much trouble, but having all 3 occurring probably did contribute to packet fratricide. From my point of view, the collisions did not interfere with our ability to track payloads.

A connected-mode QSO would be interesting as an experiment, and probably worth documenting as a record. It certainly would be more difficult. But with the CRC(?) built into all packet decoding, including UI frames, we have data integrity checking. We just don't have the connected-mode ACKs going back to tell the originator the receipient got the packet - instead we manually acknowledge it by a return UI message.

From: Steve KA5YFC
Topic: 850 Message: 850

Just as an FYI, the SSTV seems to have worked a lot better than I thought initially. AB0DP, from Wichita, copied a large number of our pictures and has put them on the web. I think that a lot of the dark area we were seeing on the left edge of the picture was actually, and here we go, I still don't believe this, it just can't be, but it might be, hold on to the edge of your seat, it may be actually the edge of space. After reviewing the better pictures from Guy's set up, you can see that each frame is changing even though it may be only slightly. Also note that it appears that the images are rotated 90 degrees. Use any standard photo editor to rotes the images right 90 and they will be much easier to understand the orientation.

I think that I have figured out why my received images may have been of very poor quality, it seems that the radio had moved frequency to 147.575 instead of .585. Must write note, lock frequency after setting so that it doesn't get accidentally changed, hihi. Also, I need to replace the 15 year old mag mount antenna as the coax and base are about toast.

For a view from the edge of space, take a look at http://fmsstv.net/ and then click on the Special Edition link on the left. Thanks to Guy, AB0DP, for collecting these images.

Next project is to figure out a way to overlay the location and altitude data on each frame so that we can see the important information. Hmmmm, how can we do that?????? Where's that manual at?

73,
Steve

Mark, I think all of HABITAT SkyLab teams were tracking APRS on 144.34. I don't think any of us were transmitting during the chase though. My mobile APRS+ was set up to digi through NSTAR (set up for past attempt), however, I used BallTrak for chasing. DUH!

There was a long time when all the trackers in Chase group 2 didn't hear the balloon, I think it was because we were under it. Chase group 1 monitored packets, we couldn't hear, about 5 or 10 miles further South of us at Newton. Hmm, maybe I better check on that. I'm not sure they were monitoring APRS.

But with the CRC(?) built into all packet decoding, including UI frames, we have data integrity checking. We just don't have the connected-mode ACKs going back to tell the originator the receipient got the packet - instead we manually acknowledge it by a return UI message.

I was riding shotgun with Harry and definitely saw N9XTN-9's two messages of
"Hi Harry" on our laptop in the car. The laptop crashed shortly afterwards so
not sure if Harry has anything on the log file he can find.

855. QSO records - manual operation required(?)

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-07 12:46:04 UTC
From: Ralph Wallio, W0RPK
Topic: 855 Message: 855

Others have already mentioned this but to make it formal, I propose that Amateur Radio High Altitude Ballooning QSO records require manual operator controlled transmissions of all QSO requirements. This proposal would not allow automated APRS message ACKs to satisfy minimal QSO requirements. Comments will tell us whether we have a consensus of opinion.

From: Mike Manes
Topic: 831 Message: 856

Hi Ralph,

I wish I'd turned on MSTamp on the W5VSI-1 TNC and set DAYtime to CDST.
But I was distracted by silly stuff like filling, launching and
tracking the balloon ...

I think that an ARQ link would be the easiest way to QSO, since the
TNCs automatically handle lost and/or corrupted packet frames. Using
UI requires the ops at both ends to "guess" whether or not to take
another shot. UIs are >especially< tough to pick out from a busy
channel as well, as you prolly saw when parsing my raw log file. That
appears to have been confirmed by your own account of ARQ vs UI
over meteor scatter paths, which are tough to get even one whole
frame thru!

Altho most balloon APRS digis were time-slotted, many of them were
"deaf" beacon generators and thus couldn't abide CSMA rules. These
are great when they have a freq solo, as is the case with most
balloon flights -- but 144.34 was nearly a continuous din of packets
and collisions. About half the W5VSI-11 UI beacons got stepped on,
despite time slotting and adherance to CDMA rules.

Now, I'll be the first to admit that I did gen some non-slotted
UI frames, e.g. TLM and BText, but I set them to run no more often
than every 5 or 10 minutes.

So I guess I'm confused by your recommendation to standardize on
UI vs. ARQ for EBBE QSOs.

Hi Guys,

I must reiterate that, IMHO, the only legitimate packet QSO is a full ARQ connect, where the TNCs at both end generate impassive and objective acknowlegements of each frame of data. And with ARQ, the burden of wondering whether your last UI got thru is borne by the TNC rather than quizzing you whether or not to repeat your last UI.

The QSO data should be keyboard-generated in real time by ops at both ends, rather than automated responses such as CText or PBBS postings.

For example, would this UI exchange between W0ABC and NOISE count as a QSO?

At 1000, W0ABC beacons to GPSL via EOSS, NSTAR:

QRZ? EBBE de W0ABC

This transmission could easily be a simple BText string repeated periodically thru the command Beacon Every 60, even when 'ABC's OTL. Who's to know?

At 1030, N0ISE sees that UI beacon during a scrollback and returns, via NSTAR, EOSS:

W0ABC de N0ISE QSL

Which may or may not make it thru unscathed to W0ABC's TNC and may also be just another automatic BText entered after N0ISE notices W0ABC in the MHeard list.

I think not. The following in EITHER station's log is unquestionably a QSO, however:

```
cmd: C N0ISE via EOSS, NSTAR
*** Connected to NOISE via EOSS, NSTAR at 1030
Hi Harv. You there?
You betcha, Bubba. TNX es 73!
73 es CUL Harv de W0ABC
*** DISCONNECTED at 1032
cmd:
```

BTW, I think that K-Nodes offer a far better chance of making an EBBE ARQ happen. In a multiple digi link, a single bit hit on any one of the 3 radio paths will stop a frame from getting thru intact to the other end. And for an ARQ link, the far end station's ACK has 3 more shots at getting wiped enroute back. So a single bit hit on any one of the 6 legs is enough to force a retry over the whole path.

As many packet ops have learned, making a multi-hop digi QSO go,
especially where one or more legs are weak, can be quite tedious.

However, with K-Nodes, each leg is separately ack/nacked before it's
passed on the the next leg. Thus if the bit hit occurs on only one
leg of the path, a retry is generated just over that leg rather than
over the whole 6-leg round trip, thus mitigating the traffic loading
on that freq.

My $0.02 ...

RE QRM wiping out APRS beacons: I know for sure that at least half
of W5VSI's GGA's got clobbered, including the one at 88,999 ft; I had
to pull that one out of the BLT log aboard the KCP-3. There were times
when 4 or 5 minutes went by with no new altitude data being heard from
the EOSS bird. Next year, we should limit beaconing on a common freq
to just time-slotted APRS GGA's, assign separate freqs to each bird or
some combo of both.

This is news to me. What OSCAR modes are being used for automatic QSOs that are being counted for distance records by any award granting organization? AMSAT offers awards only for cumulative QSO counts. ARRL offers distance recognition for all VHF-and-up bands but they recognize only longstanding QSO requirements which do not allow automated or relayed/repeated operation.

Amateur Radio High Altitude ballooning does not offer awards (but we could if there is interest). We collectively offer recognition in several record categories including station-to-station QSO distance. We note that these distance records were via EBE or EBBE and could even mention modes as we do in the HF category.

Incidentally, QSOs via high altitude balloons are not valid for ARRL awards. ARRL allows OSCAR QSOs but only for awards with OSCAR endorsements, e.g. Satellite WAS and DXCC where all QSOs have to be via OSCAR.

I believe that there should be two categories.

1.) QSO

2.) Automated Link

How and Why?

The QSO link should be a manual exchange of individuals keyboard to keyboard.
This would demonstrate "long term" connection viability.

The Automated Link would be able to demonstrate that a quick opening was
discovered by computer programs (most likely APRS) and two way exchange of
data was possible. It would be a record similar to the Telemetry reception
record. But it would demonstrate acknowledged data rather than blind
reception.

But, that wasn't the question really was it? For a QSO, well what is a QSO?
From:

http://www.arrl.org/qst/glossary.html

QSO -- A conversation between two radio amateurs.

I believe that leaves out totally automated connections.

861. HABITAT SkyLab was NOT a "derelict"

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-08 03:05:26 UTC
From: Don Pfister
Topic: 861 Message: 861

Rick, regardless of your report our balloon was not a "derelict". I do not know who or why that was reported but it is not the case. While our flight was not like the others, our balloon configuration was not like the others.

While we did not maintain radio contact with the other groups, we did maintain contact with our balloon at all times. It is true; that at sometime during decent our primary tracker was damaged, we are unable to determine when that occurred do to others not keeping to the pre-arranged time-slotting of beacons. Our secondary tracking system worked perfectly and we walked right to the payload after it landed. Our group was the only ones using our secondary tracking frequency, good thing perhaps.

In my opinion our flight was near perfect. We flew almost 100 miles, but landed about 15 miles from the launch site. Perhaps the closest to the launch site of any group there. I believe we had the longest duration flight of any of the groups. I don't think we could have asked for a better flight. We didn't land in the MUD either. ;-) We landed a few hundred feet W of 95th and Plum. A nice little trek, back to the road and we returned to Hutch for lunch. I KNOW we proved you can make a latex flight 'float'! I'm not sure we could ever have another flight so near perfect. We just might try though. ;-)

I would appreciate your updating your recap web page to set the record straight. IF you know who reported that our flight was a "derelict" you might correct them as well. ;-)

Thanks,
Don KA0JLF

Hi Ralph,

Awarding recognition for accomplishments and advancements was one of
the functions that I had in mind for the now much-maligned national
amateur high altitude balloon organization ... not that the present
"Wallio Hall of Fame" doesn't do a pretty good job already, tho.

All of this discussion would be meaningless were it not for the accomplishment of flying EOSS and NSTAR missions with digital repeating payloads at the same time. The efforts of these flight teams are far more significant than a few minutes of participation by OMs at home in their cozy shacks. We encourage participation by maintaining distance records but MISSION/PROGRAM is the most important column.

There is a longstanding definition of a minimal Amateur Radio QSO. Call signs and one other piece of information must be exchanged and acknowledged. This usually means both call signs are transmitted by both stations (although this does not always happen during contests). The one additional piece of information, e.g., grid squares, signal reports or names, should be acknowledged but does not need to be repeated, e.g., "Roger all that" is enough.

These minimal requirements can be satisfied with full-blown packet connections or UI exchanges or APRS messaging exchanges. Regardless of which method used we should try to satisfy the minimal requirements. Should we accept process as evidence, e.g., packet header information? I have lost track of what the ARRL does but, for our little world, I think we can. We are not talking about fully automated robot QSOs, just call signs and paths in packet headers. Harv and Bubba still need to be at their keyboards.

The best most-efficient highest-probability-of-success method, connections, node connections, UI exchanges or APRS message exchanges, depends on circumstances at the moment for the two stations and payload capabilities. Our N9XTN<>W0RPK QSO was via UI packets but the attempt could easily have failed. It was a pure fluke that Mark was parked instead of moving and therefore could be paying attention to packet activity -and- it was a pure fluke that Mark was paying attention to packet activity at just the right time to see my initial QRZ v EBBE. We would have had a much higher probability of success with APRS messaging but only because Mark was using APRS software.

Mike and Rick were safely driving and navigating rather than watching the packet stream for UI and APRS messaging packets. If I, in my cozy shack, had a better understanding of Mike and Rick's circumstances I would have attempted a direct or node connection.

If I had arranged a QSO with a distant ground station attempting to set a distance record, we might have successfully used UI exchanges because we knew each other were watching the packet stream (possibly while coordinating our attempt via a simultaneous 40m QSO).

Perhaps understanding circumstances is the key to success rather than establishing a common method. All we have to do is announce our individual

circumstances and methods before flights so others will know what method to use.

Perhaps we can give recognition for accomplishments and advancements without the overhead of an umbrella organization. It is common for this process to start with nominations, e.g., the Ig Nobel Prize (http://www.improb.com/ig/ig-top.html), followed by a winnowing process and final selection by a peer committee. Awards could be serious, e.g., breaking the altitude record, or in fun, e.g., longest recovery time, but nothing is automatic. Nominations and review would be required.

Recognition could be given at our GPSL evening dinner. Coordination would be a reasonable responsibility for one person (per year) including soliciting, receiving and forwarding nominations, coordinating the decision process and arranging for certificates, all in a couple of months before GPSL (starting May 1st?). A web page would announce and archive results.

My format for our records page is getting pretty big, ~450kB. I am thinking of rebuilding it this winter so it loads in more reasonable time for dial-up users. Perhaps a main page with the top 3 in each category and links to sub-pages for each category with full detail.

Hi Ralph,

Hmmm .. the IgNobel is sponsored by Jour. Irrep. Results, isn't it?
Maybe N&V, CQ VHF or ATV Journal would be willing to do the heavy
lifting at a national level. Joe Lynch W6CL expressed his sincere
intent to support ham radio ballooning in earnest. Of course, there's
some pecuniary interst there ...

Re awards: EOSS's very own version of the IgNobel is the coveted

868. ARHAB articles and awards vs for-profit journals

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-09 15:39:18 UTC
From: Ralph Wallio, W0RPK
Topic: 868 Message: 868

Hmmm, maybe now is the time to offer an opinion that may generate flaming responses.

I am not a subscriber to Nuts & Volts, CQ-VHF or ATV Journal. Consequently I will not be reading Paul's columns in Nuts & Volts nor will I be reading Zack's GPSL2004 article in CQ-VHF. I believe something is going wrong when our collective information is being published in for-profit journals rather then in extensive web pages that already exist and are available to everyone.

I believe information in these articles and columns belongs to all of us. There is not one project, program, individual or author that has not benefited significantly by learning from time, energy and money invested by other members of our informal group. Most group members regularly go far out of their way to openly publish details of their successes and failures in freely accessible web pages.

Only a very small fraction of content in Nuts & Volts, CQ-VHF, ATV Journal will ever be dedicated to Amateur Radio High Altitude Ballooning. We can serve our very small group much more efficiently and dependably via web publishing that is available to experts and fledglings alike without the subscription expense of for-profit journals.

I do not believe annual coordination of a nomination-based award scheme is any where near "heavy lifting". Volunteer coordinators and peer reviewers will invest a little time and energy but there will be very little expense.

Just my opinion!

I also do not subscribe to either mag, although I do pick up a copy of each off the news stand from time to time. If individuals like to submit articles for publication that is their right and if they also wish to not make that information available to the masses through the web, that is also their right, but one of the things that has drawn me to ballooning is the sharing of information by almost all balloon groups, either by email or websites. I would like to see everyone continue to share and not confine their accomplishments and findings to publications!

Peace!

I appreciate the free exchange of information - it was invaluable to our group, especially as we started out. I will stick my neck out and say that I pride myself of keeping Project: Traveler's website one of the most up-to-date and content rich ballooning sites on the net.

That being said, from my standpoint, I had nearly $100 in out of pocket expenses for things like the coffee/tea, name badges, borrowing the truck for the helium, etc. When I had the opportunity to get "reimbursed" for some of those costs by doing a write-up, I jumped at it. Unfortunately, I'm kind of written-out at the moment and haven't posted much to the website other than PT's standard Flight Analysis.

But, keep in mind that the "average" ham is more likely to read about ballooning in CQ or Nuts & Volts than they would be to just stumble across one of our websites.

And with that, I'll throw the monkey on someone else's back. If someone were willing to throw a few paragraphs together, and/or some pictures, I would happily post them to the GPSL 2004 website.

I'll chime in, as an author of a ballooning article in the previous CQ VHF issue.....

The articles for ATVQ and CQ VHF are rather non-technical in nature and have more to do with either recapping an event and/or providing an intro to the hobby. The articles from Paul I've seen in N&V are decidedly technical, but are geared to spurring ideas in microcontroller users outside of amateur radio ballooning. In both cases, I believe the articles repackage much of what can already be found on the web.

I have already gotten e-mail contacts through Paul's N&V articles from people totally outside the hobby until now. Not so much yet from CQ VHF, but it's only been out a few weeks.

I view articles in the for-profit magazines as a way to reach people who may not know of our existence. Simply publishing a web site doesn't get you eyeballs on the page - either the person has to search for you specifically or you depend on a serendipitous bout of near-random surfing. We are NOT reaching a wide audience with our websites - I had about 8000 hits on my main NSTAR page between Apr 2003 and this past June. Many of those were bots.

OTOH, a VHF enthusiast who subscribes to CQ VHF or ATVQ who doesn't know about our hobby reads about us in an article and may become interested enough to participate. I can read the various news web sites all day long, but I still subscribe to the Omaha newspaper because it brings me things I might not read otherwise.

Unless this hobby exclusively publishes information in the magazines that is not available by the web, I don't see a threat. I don't see this happening, either, given our group's track record on open collaboration and information sharing. The articles are a good means to reach out beyond our current small audience to attract new people, and I for one STRONGLY ENCOURAGE people to write for the various publications.

This brings me back to a need for a one-stop shop for amateur radio ballooning on the internet. We collectively have a LOT of stuff out there, but it's not indexed or cross-referenced, and an outsider has a devil of a time sorting it all out. It's a pain for me, and I know what I'm looking for.

872. Re: [GPSL] My thoughts about a national website and magazines

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-09 18:51:34 UTC
From: wb8elk@aol.com
Topic: 872 Message: 872

OK...here's my 2 bits worth...actually, 2 bucks worth <smile>.....

I personally feel that there should be efforts in both types of medias....free websites and paid journals. I've found that usually most newcomers find out about ham ballooning from reading articles in magazines or through word of mouth...radio clubs, school projects etc. I've noticed the disturbing trend that even among senior class engineering students, many of them have never even heard about ham radio.

I've written dozens of articles in several magazines promoting the idea of ham radio ballooning in the late 80s and early 90s...the July 91 issue of 73 magazine even had a ham balloon on the front cover (lots of good foxhunting articles in that issue)....the August 91 issue (another balloon on the cover) was practically devoted to ham ballooning with my 5 page how-to article inside....I even had Wayne Green fired up about the idea and we did a few launches from the headquarters building and he mentioned ballooning in his column many times after that.
As a side note, when we bought an article for 73, we only had rights to it prior to and during the publication month when the issue was on the newstands...after that the author could resell it or post it publically in it's entirety with the only caveat that they reference that it was originally published in 73....at least this policy was true when I was editor there. There was no reason that they couldn't post a rewritten version (or by another author) on the internet before, during or after publication however.

Now to the other side of the story.....the above was certainly true when the internet was in it's infancy....however, it is getting easier and easier to find out about ballooning through web searches....this is a great place to find out what the other groups are doing and the free exchange of information...it's an invaluable source of techniques and technical information.....but this
mostly only gets to the people who already have an interest in ballooning....that's where articles in national (or international) publications really have a
place....to inspire newcomers into both ham radio and a way to use ham radio in a fun, exciting manner that can do some real science....to reach out from the newstands and grab their attention.

So in conclusion:

I think we need a presence in BOTH paid publications AND free access websites...maybe a free e-zine or online newsletter about ham ballooning?....but this takes a huge effort or a dedicated person to maintain and update the website...(as those of you with websites truly know). I don't have much info (and very outdated) stuff on my website: www.wb8elk.com.....mainly due to a lack of free time to do so....I'm going to try to change that this weekend, however.

I also agree we need a national (or international) web domain that is easy to remember so we can point or link to all the other groups....Although several groups have amazing websites with links to other groups (some more complete than others)...it still would be nice to have a site with "balloons" in the domain name.

To that end, I offer the use of the domain "www.hamballoons.com"....to anyone who wants to manage it and put links, announcements, articles, FAQ's online as a national (and international) balloon forum website. Even if it just shows a link on the front page to all the other groups that would be handy and easy to remember. It would be nice that in addition to the launch annoucement lists on Yahoo and via HABLIC, that there be an automated posting area on the website for launch announcements....something like the "dxworld.com" propagation pages. The idea is to centralize so information can be found.

If I get a chance, I'll sketch out a framework of what I have in mind on the "hamballoons.com" website this weekend.

OnSet Computing, the manufacturer of the Hobo data logger has set up the OnSet Prize for 2004. The group with the highest flight this year will win a 4 channel, 8 bit data logger, a copy of their advanced software, and a remote temperature sensor. They are worth about $200 and all you have to do is get the highest flight this year.

Please announce your flight in advance and post the highest altitude packet recieved during the flight. I'll be traveling this winter, so I may be able to present the award myself. If not, I'll send it in the mail.

OnSet also send some catalogs so you can look at their other products. The data loggers are used by the BalloonSat programs and I had one to show at GPSL. If you wouldn't mind, I'd like to send a couple of catalogs to each group. I was hoping they would arrive in time for GPSL so I could include them with the packets we handed out this year. Please reply back to me with an address I could send your group some of the catalogs.

We need to keep track of high flights this year. Ralph, is this something you could do for us?

Thanks everyone,
Paul

Hi Ralph,

Paul seems to have a whole lot better luck ni getting published in
the broader journals than EOSS does - we just collect rejection
notices ...

And I do think it's important to get our story out beyond our own
little choir. Not only to expand interest amongst other clubs, but
to bring more new members into out existing ones. This is not to say
that we should publish nitty-gritty advanced ballooning technology
stuff in QST, etc. We have a pretty good forum(s) (fora??) for that
already.

The only ham rags I subscribe to are QST and QEX -- and those go unread
for too long already. But one of our members does get N&V and brings
in cc's of Paul's column to pass around at our meetings.

I agree that running an awards program for balloning is no big deal
(altho I suspect you're a better judge of that!). But organizing
the GPSL is a HUGE burden, and that's the "heavy lifting" that I
was referring to. Eight EOSS members spent 9 months putting together
the 1st (and Last?) Small Balloon Conference and Proceedings back in
'93. The GPSL conference isn't burdened with published proceedings,
but it sure would be nice to have such a document on the shelf every
year. And that's where a publisher could really shine!

Paul, here is our landing Lat/Long.

Has anyone made a map of all flights yet?

We are working on moving secondary data over to our primary data (144.34) to add the last part of decent to a mapable file.

Great flight! Lots of fun!

Our newest ham, should have it ticket this week. He successfully passed his license exam Saturday! Our two newest: Dean KC0SSI issued 7/1/04, Chris passed the exam 7/10/04. GPSL 2004 milestones for HABITAT SkyLab! ;-)

Could you send me the instructions for the FTP site. I've got a variety
of photos, including aerial, to upload.

Also, could you resend the photos that Shari took - my spam filter ate them.

Thanks,
Zack

893. GPSL 2004 track maps

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-13 23:35:54 UTC
From: Mark Conner
Topic: 893 Message: 893
Attachments: 2 described; binary payloads are missing from this source WARC

Attached is a GIF showing all 6 balloon tracks from this year's GPSL. Also I have a Street Atlas 9 file with the same info.

Track data was recreated from the FindU archive and may not contain the very last position reports, but at this scale the landings are probably within the blue squares in the GIF. In the HABITAT case, Don sent me his Rino log data and I reformatted it into APRS posits so his track is truly start to finish.

895. NSTAR landing location at GPSL

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-15 00:12:18 UTC
From: Mark Conner
Topic: 895 Message: 895
Attachments: 1 described; binary payloads are missing from this source WARC

As many of you know, we had a little difficulty finding the NSTAR payloads at this year's GPSL. The attached graphic provides some background.

The main payload (N9XTN-11) exhausted its batteries prematurely, at about 29,000 ft on descent. The backup payload (N9XTN-12) continued to function, and its last airborne position at 2788 ft AGL was digipeated and I was able to receive it while I was over 30 miles away helping Paul recover his flight.

After making a couple of loops around the section where it landed, we were unable to hear any signals from any of the payloads. Part of the EOSS T&R team also joined us and began listening. We made contact with the landowner and he volunteered to take us out in his 4WD truck to help us look. Initially we looked too far south, then we spotted the payloads after going north about 300-400 yards.

Although I took my GPS with me for the hunt, I forgot to enter the last known location into the GPS. This might have helped us focus our search a little better, since we knew the overall track and speed. With a 30-mph forward speed, a 1200 ft/min descent, and about 1200 ft to the landing, I figured the payload could have traveled up to a half-mile from its last position. The actual distance was only 0.28 miles and a little to the left of the expected landing position.

Michael,

HABITAT SkyLab is in Overland Park. Please check out our page at:

http://habitat.netlab.org/index.shtml

Please feel free to contact us at habitat@... or ka0jlf@...

If they are able to come into Overland Park on Saturday, 17 July, we
will be meeting at the Godfather's at Antioch and 83rd St. at 12:00ish
till around 4:30pm. We would be glad to talk to them.

Please pass this information along and if they need a telephone contact
they can e-mail me direct for the number. My e-mail is ka5yfc@....

Thanks for the heads up.

Steve

I'd be willing to maintain the page if someone could come up with an ISP. Ideally we should have at least a couple hundred megabytes of storage where we could put videos and plenty of photos online.

Having PHP/MySQL would be a huge plus as far as I'm concerned.

Zack Clobes, W0ZC

paul.verhage@... wrote:

Paul

Perhaps we can give recognition for accomplishments and advancements without the overhead of an umbrella organization. It is common for this process to start with nominations, e.g., the Ig Nobel Prize (http://www.improb.com/ig/ig-top.html), followed by a winnowing process and final selection by a peer committee. Awards could be serious, e.g., breaking the altitude record, or in fun, e.g., longest recovery time, but nothing is automatic. Nominations and review would be required.

Recognition could be given at our GPSL evening dinner. Coordination would be a reasonable responsibility for one person (per year) including soliciting, receiving and forwarding nominations, coordinating the decision process and arranging for certificates, all in a couple of months before GPSL (starting May 1st?). A web page would announce and archive results.

My format for our records page is getting pretty big, ~450kB. I am thinking of rebuilding it this winter so it loads in more reasonable time for dial-up users. Perhaps a main page with the top 3 in each category and links to sub-pages for each category with full detail.

I have bandwidth and a Linux server with Apache 2.x, PHP, and MySQL that
would fit the bill. It has 120+ GB of free space and I can always throw
on another 250GB drive if we really needed it. Sorry, no Windoze here.

Something to consider....

That would be fine with me - that's about what I'm doing all of my new development on now days.

I assume that it has a public IP that we can point a domain at?

Paul

Perhaps we can give recognition for accomplishments and advancements without the overhead of an umbrella organization. It is common for this process to start with nominations, e.g., the Ig Nobel Prize (http://www.improb.com/ig/ig-top.html), followed by a winnowing process and final selection by a peer committee. Awards could be serious, e.g., breaking the altitude record, or in fun, e.g., longest recovery time, but nothing is automatic. Nominations and review would be required.

Recognition could be given at our GPSL evening dinner. I checked online and found that the following two domain names are available so I grabbed them for use as a GPSL domain name (sadly GPSL.ORG was not available).

http://www.gpsl.info

and

http://www.gpsl.biz

I can point them to any URL website.

I also have: "http://www.hamradioballoons" that I can point to a site as well.

Another possibility is having the conference on Saturday, flight Sunday, backup date Monday. That might save a day of vacation for some people. I can go either way.

I had also thought about having it Memorial Day weekend. The Iowa corn will be a heck of a lot shorter, but the weather is more iffy (more likely to have stronger winds surface and aloft in May than July).

Subject: Entry for greatest telemetry downlink reception range

Hi Ralph,

Here's my entry for the Greatest Telemetry Downlink Reception Range
category (VHF)....mode BE (Balloon Earth).

from the KC8MSY balloon on 144.34 FM APRS on July 17th, 2004.

I started to receive the balloon weakly at 1650z (about 103,000 ft at that
point) and it rapidly got strong enough to hear on FM. I started to get good
copy on the packet telemetry at 1657:45 when it was at 108,091 feet over
Pandora,
Ohio. I copied the telemetry (up to a strong S-4 signal) until burst around
1703:05z when it was at 111,363 feet. There may be one more altitude packet
that I didn't receive. I'll check with the launch team. When I find out the
final
altitude packet, I'll have them send that to you for the altitude records
section.

My QTH coordinates in Falkville, AL (Wilson Mountain):

34d 24.53m
86d 48.77
1120 ft elevation (500 feet HAAT.)

KC8MSY balloon at furthest reception (1703:05z GPGGA packet):

40d 56.8524
83d 52.397
111,363 ft altitude

According to the online GCD calculator I used that works out to 479 miles.

My station stats:....Icom 706, Cushcraft 11-element beam on tripod 10 feet off the ground (on the edge of a 500-foot tall cliff), Kantronics KPC3.

A portion of the recorded packet information I received here in Alabama on 144.34 MHz FM:
(I used the last $GPGGA frame received (1703:55z) for my distance calculation.)

I can't wait to see someone break the 500 mile balloon reception barrier!!!!....I calculated that at 479 miles, I'd start to pick up the KC8MSY Ohio balloon at 103,000 feet and it came out of the noise at precisely that altitude. Since the balloon was almost over my parent's farm in Ohio, I told my Dad (WB8MSJ) that if he put up a 110,000 foot tall tower we could work every day on 2 meters. He replied that he had trouble climbing a 50-foot tower, let alone one that tall.

922. Cheap balloons?

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-19 15:20:54 UTC
From: Gene Harlan
Topic: 922 Message: 922

Cheap is not always the best, but for your information. I just discovered this site.

http://www.sciplus.com/sale.cfm

Weather Balloon!
The weather balloon is a perennial favorite at A.S.&S. This one, of tan-colored latex, is rated at 10 feet dia but we'd stop at 8 feet to be on the safe side. It's available with a 1-1/2" x 3-1/2" dia O-ring and heavy 1-3/4" dia nozzle, or with a standard reinforced 2-3/4" neck. (Both have a dusting of talc as a preservative.) Great fun, but remember -- this is, indeed, a meteorological balloon. It's not made to bump into anything sharper than a cloud. Hit concrete, roof shingles or a patch of crabgrass with it when it's inflated, and that balloon is history!

They are selling for $7.95.

It is under the sale items. No connection with this company and only discovered it as it was recommended by an ATV'er that I met at a hamfest a couple of weeks ago.

Here is the response I got from them...

Dear Harry,
Thanks for your question. All three of the weather balloons that we have in stock were manufactured by Kaysam International. 34713 and 34751 were made between fall 2000 and spring 2001, and weigh 800g and 700g respectively, and 29842 was made in early 1984, and weighs 2210g. Please let me know if I can be of any help to you in the future.

Best regards,

Hi Paul,

ORB's official altitude was...
KC5TRB-11>APT310,N9XTN-9*,WIDE3-3:
<UI>:/145935h3812.74N/09729.20WO251/007/A=082944

My last name is spelled Mueller.

Thanks!
73

I use a DIY EXCEL spreadsheet with Geometry Functions add-in (see http://nmml.afsc.noaa.gov/Software/ExcelGeoFunctions/excelgeofunc.htm) to calculate distances between sets of coordinates for our records. This method yields the following distances:

KC5TRB 15.13 miles
W0ZC 51.27 miles
W5VSI 11.44 miles
N9XTN 14.11 miles

All of these prediction errors exceed our collective records average of ~8.2 miles.

NSTAR had a max altitude of 84,875 ft.

Website is http://www.nstar.org

The highest for W5VSI-11 available on FindU was 88,027 ft, but they may have additional data available:

W5VSI-11>APRS,qAR,W0ZC:$GPGGA,152854,3812.0267,N,09732.1616,W,1,05,1.03,26831.2,M,-26.9,M,,*40

There's a typo on my touchdown point. It should be 97W for the touchdown. That works out to be less than 6 miles.

Also, my burst altitude was 94,467ft (28,794m).

Too bad there wasn't one for longest flight (time), closed to launch site, or well enough whinning. ;-)

HABITAT SkyLab's new domain and web site is: http://habitatskylab.org please update links on your pages. ;-)

Paul, since I saw these seemed to be blank in your Word Doc, I thought you may have been asking.

THANKS! (Big Thanks)

932. Re: [GPSL] Cheap balloons?

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-20 03:40:20 UTC
From: Mike Manes
Topic: 922 Message: 932

Hi Gene,

There's a reason they're so cheap: latex deteriorates over time, as some of us in the balloonacy community have learned. These bargain bin bags lose their economic attractiveness when they burst at fill, dumping $50-100 of helium ... Kinda like putting recycled motor oil in your new Lexus crankcase ...

They're fine if you're filling 'em with homebrewed hydrogen and don't care much about burst altitude.

Hi Paul,

Give Rick Von Glahn N0KKZ the credit for the EOSS-80 prediction.

And here's our max GPS altitude:

*** 1030 CDST: Burst at 88,999.3 ft MSL; avg ascent 1029 fpm ***
$GPGGA,152954,3811.9076,N,09732.9173,W,1,05,1.03,27127.0,M,-26.9,M,,*48

The URL for the EOSS web site is: www.eoss.org

Corrected for this typo my calculation of Zack's prediction error yields
5.27 miles. This is significantly better than our collective average of
~8.2 miles. If submitted for placement Zack's prediction error would place
15th-of-68.

Considered it submitted - do you need anything else from me on that?

I still have your email regarding the GPS-18 and the other rates. The
GPS is sitting beside me, I just need to make up an adapter cable to
query it from the PC.

Zack

Glad to have to updated error of prediction.

Okay, Zack has both awards. So I will give the second award to second place, which would be EOSS.

I'll rewrite what I have and submit it again for final corrections.

I have a presentation to give at AstroCon 2005 on Friday. I should be able to email the correction at my sister's house.

942. Fixed Awards Report

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-22 06:03:03 UTC
From: pverhage1960
Topic: 942 Message: 942

Here's the updated GPSL Awards report. Please look it over and identify any remaining errors.

I couldn't add an attachment, so I have copied and pasted the text

Thanks,
Paul

++
GPSL 2004 Awards

Due to the generous support of both Nuts and Volts magazine and Parallax, the Great Plains Super Launch (GPSL) 2004 was able to hold two competitions. Amateur near space teams vied for the most accurate landing prediction and the highest altitude achieved. Winners of both competitions would receive a one year subscription to Nuts and Volts magazine and a Parallax Basic Stamp 2-IC.

Landing predictions were made prior to launch of the near spacecraft and compared to the final landing site as recorded by a handheld GPS receiver. Altitude data transmitted during the flight over APRS was used to document the highest altitude reached by the near spacecraft. Below are the results from the GPSL 2004 competition.

Harry Mueller (KC5TRB) of Oklahoma Research Balloons
Predicted Landing: 37.8939 N 97.2052 W
Recorded Landing: 38.1008 N 97.2960 W
Prediction Error: 0.2069 N 0.0908 W =
15.13 miles
Highest Altitude: 82,944 feet

Zack Clobes (W0WR) of Project: Traveler
Predicted Landing: 37.9696 N 97.2434 W
Recorded Landing: 38.0285 N 97.3048 W
Prediction Error: 0.0589 N 0.1014 W =
5.27 miles
Highest Altitude: 94,467 feet

Rick Von Glahn (N0KKZ) of Edge of Space Sciences
Predicted Landing: 37.9111 N 97.1770 W
Recorded Landing: 38.0486 N 97. 2941 W
Prediction Error: 0.1375 N 0.1171 W =
11.44 miles
Highest Altitude: 88,027 feet

Mark Conner (N9XTN) of Nebraska Stratospheric Amateur Radio
Predicted Landing: 37.9683 N 97.2107 W

Recorded Landing: 37.9070 N 96.9637 W
Prediction Error: 0.0613 N 0.2470 W =
14.11 miles
Highest Altitude: 84,875 feet

Congratulations to Zack Clobes for finishing in first place and Rick Von Glahn for finishing in second place at GPSL 2004.

You can read more about the participants of GPSL 2004 at their websites
EOSS: http://www.eoss.org
HABITAT: http://habtiatskylab.org
NSTAR: http://www.nstar.org
ORB http://members.cox.net/hhm_74775/orb/
Project: Traveler http://www.rckara.org/project_traveler/

GPSL 2005 will be hosted over the Fourth of July weekend by NSTAR. All amateur near space groups and other interested individuals are invited to participate. A formal announcement will be made at a later time. In the mean time, please subscribe to the GPSL email list under Yahoo Groups for information on this, and other, amateur near space events.

943. Re: [GPSL] Fixed Awards Report

Yahoo group: GPSL (2002 — 2008)

From: Ralph Wallio, W0RPK
Topic: 942 Message: 943

A few changes to consider:

1) Zack's call is W0ZC. W0WR is the RCKARA club call.

2) It is my impression that a discussion continues about when GPSL-2005 will be held. It may not be on/near July 4th.

3) I suggest again that "Amateur Radio" be part of all names for our hobby. I am also concerned that "Near Space" is also being achieved by amateur rocketry. We are balloonists so "balloon" should be part of all names for our hobby. "Amateur Radio High Altitude Ballooning" or "Amateur Radio Near Space Ballooning" would therefore be more appropriate.

4) Prediction errors in latitude and longitude seem redundant. Errors are great circle distances between two sets of lat/long coordinates as calculated by longstanding navigation methods, aka, spherical trig.

Here's the updated GPSL Awards report. Please look it over and identify any remaining errors.

I couldn't add an attachment, so I have copied and pasted the text

Thanks,
Paul

++
GPSL 2004 Awards

Due to the generous support of both Nuts and Volts magazine and Parallax, the Great Plains Super Launch (GPSL) 2004 was able to hold two competitions. Amateur near space teams vied for the most accurate landing prediction and the highest altitude achieved. Winners of both competitions would receive a one year subscription to Nuts and Volts magazine and a Parallax Basic Stamp 2-IC.

Landing predictions were made prior to launch of the near spacecraft and compared to the final landing site as recorded by a handheld GPS receiver. Altitude data transmitted during the flight over APRS was used to document the highest altitude reached by the near spacecraft. Below are the results from the GPSL 2004 competition.

Harry Mueller (KC5TRB) of Oklahoma Research Balloons
Predicted Landing: 37.8939 N 97.2052 W
Recorded Landing: 38.1008 N 97.2960 W
Prediction Error: 0.2069 N 0.0908 W =
15.13 miles
Highest Altitude: 82,944 feet

Zack Clobes (W0WR) of Project: Traveler
Predicted Landing: 37.9696 N 97.2434 W
Recorded Landing: 38.0285 N 97.3048 W
Prediction Error: 0.0589 N 0.1014 W =
5.27 miles
Highest Altitude: 94,467 feet

Rick Von Glahn (N0KKZ) of Edge of Space Sciences
Predicted Landing: 37.9111 N 97.1770 W
Recorded Landing: 38.0486 N 97. 2941 W
Prediction Error: 0.1375 N 0.1171 W =
11.44 miles
Highest Altitude: 88,027 feet

Mark Conner (N9XTN) of Nebraska Stratospheric Amateur Radio
Predicted Landing: 37.9683 N 97.2107 W
Recorded Landing: 37.9070 N 96.9637 W
Prediction Error: 0.0613 N 0.2470 W =
14.11 miles
Highest Altitude: 84,875 feet

Congratulations to Zack Clobes for finishing in first place and Rick Von Glahn for finishing in second place at GPSL 2004.

You can read more about the participants of GPSL 2004 at their websites
EOSS: http://www.eoss.org
HABITAT: http://habtiatskylab.org
NSTAR: http://www.nstar.org
ORB http://members.cox.net/hhm_74775/orb/
Project: Traveler http://www.rckara.org/project_traveler/

GPSL 2005 will be hosted over the Fourth of July weekend by NSTAR. All amateur near space groups and other interested individuals are invited to participate. A formal announcement will be made at a later time. In the mean time, please subscribe to the GPSL email list under Yahoo Groups for information on this, and other, amateur near space events.

944. GPSL 2005 date discussion

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-22 14:17:36 UTC
From: n9xtn@cox.net
Topic: 944 Message: 944

I have received only one input regarding dates for GPSL 2005, and that was to have it sometime other than 4th of July weekend. I know, however, others would like to take advantage of a holiday weekend so as not to burn as many vacation days. For those groups who may attend next year, please post your thoughts on possible dates:

1) 4th of July weekend, as usual
2) Memorial Day weekend
3) Others? Mid-June is probably out due to the BalloonSat conference, and Field Day weekend is no good either. Mid-July will be the teachers' workshop at UNO and NSTAR will have a BalloonSat launch with that, but perhaps we could have the GPSL in association with that launch.

My wife and I were considering having some alternate activities for Friday while the balloon conference was going on. This would be for spouses and children who aren't particularly interested in balloonacy. The Omaha Zoo and Children's Museum are possibilities. This might make it worthwhile to bring families to Omaha next year for a mini-vacation.

Since Paul probably needs to get the awards report out, I would leave the GPSL 2005 date information in that as a generic "summer 2005" statement.

Memorial Day and Labor Day won't do it for me. As A teacher, I don't get many days of vacation during the school year. I still like the 4th of July, but am flexible.

I'll need to know the day dy December. I have to begin making reservations early in the year for my back packing trips.

I'm thinking I sent in that altitude report but ... I was wrong.

The actual max altitude was 88,999.34 ft.

It doesn't make a significant change regarding awards etc. however, that is
the correct figure.

Sorry about that!

Rick Von Glahn (N0KKZ) of Edge of Space Sciences
Predicted Landing: 37.9111 N 97.1770 W
Recorded Landing: 38.0486 N 97. 2941 W
Prediction Error: 0.1375 N 0.1171 W =
11.44 miles
Highest Altitude: 88,027 feet

948. Re: [GPSL] GPSL 2005 date discussion

Yahoo group: GPSL (2002 — 2008)
Date: 2004-07-22 19:38:20 UTC
From: Ralph Wallio, W0RPK
Topic: 944 Message: 948

Usual suspects could consider the following calendar and make wild guesses about which weekends are already taken for their groups. As examples, I find the following flights in 2004 that may be repeated in 2005:

ANSR Williams Hamfest 03Jul04

EOSS CU/BalloonSat Conference 19Jun04
EOSS CU/Upward Bound 18Jul04
EOSS CU/Spacegrant heavies 07Aug04

Groups that anticipate attending GPSL-2005 could look ahead and make guesses. We could then consider which weekend will be reasonable for the majority of potential attendees.

Paul's school year limits him to June, July and August.

There is no significant difference in Mean Zonal Winds between June, July and August. There may be a significant difference in the probability of inclement weather.

June 3-5 Possibly too soon in June (1st weekend after Memorial Day)
June 10-12 ARRL June VHF QSO Party
June 17-19 EOSS - CU BalloonSat Conference? (June 17-19 in 2004)
June 24-26 ARRL Field Day

July 1-3 Long weekend - July 4th on Monday ANSR Williams Hamfest (July 3 in 2004)
July 8-10
July 15-17 EOSS - CU Upward Bound? (July 18 in 2004)
July 22-24 NSTAR - UNO Aerospace Education Workshop? (June 24 in 2004)
July 29-31

August 5-7
August 12-14
August 19-21
August 26-28 Possibly too late in August (last weekend before Labor Day)

Please respond by the end of this coming weekend so Mark can make a decision and announcement. I will compile the results.

Would UNO be a good venue for our gathering. Would they cooperate by supplying low cost (read, "free") meeting space and support?

The following would be good for ORB...

July 29-31
August 5-7
August 12-14
August 19-21

For the Oklahoma area the following dates are not good...
July 15-16 CORA Ham Holiday (Oklahoma City)

Harry - KC5TRB - Tulsa
Oklahoma Research Balloons

I don't think the hobby would die without Amateur Radio. I think there might well be many more non-hams that would be interested in the hobby. This seems to me to be a statement "only Hams allowed". I don't think that is a message we want to send. Personally, most of the people that have helped me over the years have been non-hams!

Aren't the majority of the very students and young people we are reaching out to non-hams?

Paul, I would suggest, while many of your readers are hams, aren't there also non-hams? I think Amateur Ballooning gives us more opportunities to include others. Probably a benefit to getting companies like Parallax and Nut&Volts to sponsor us, not to mention others. But then again, people complain because we write for magazines.

I do not understand the drive to put "Amateur Radio" on everything?

OH well. FWIW,
Don

Hi Guys,

EOSS sets its flight docket in cooperation with Colo Space Grant to avoid conflicts with known alternate events, such as Field Day, ham fests, MS-150, JOTA, etc. Otherwise it's first come, first served.

So the sooner GPSL 2005 gets nailed to a date, the better chance it has to avoid getting stepped on by a Space Grant flight. I expect to be working the 2005 schedule with Chris Koehler in the next couple of months.

Topic: 944 Message: 956

I prefer the July 4th weekend since it is usually a fun time to watch the fireworks from 30,000 feet during my plane trip...I witnessed thousands of displays on my way back, but here are my ideas on alternative dates:

I think a likely and appropriate alternative might be to coincide with the UNO workshop. I prefer July since the chances for good weather and calm morning surface winds seem to make that a good choice. June seems too early for me (need a month to recover from Dayton and Field Day)....early August is another possibility, but as you go further into August, those with children have the school year starting.

Perhaps we can tie Amateur Radio Near Space Ballooning to the World Year of Physics 2005. See http://www.physics2005.org/ and note purposes, events and sponsors.

World Year of Physics 2005: Einstein in the 21st Century

The International Union of Pure and Applied Physics declared 2005 as the World Year of Physics, which coincides with the 100th anniversary of the year in which Einstein published three very influential physics papers. The United States physics community created this website to promote "plans to bring the excitement of physics to the public and inspire a new generation of scientists." Educators and students can find out about the schedule of events as well as ideas on how to become involved. The also site features a timeline of Einstein's life and achievements. To receive news and updates on events, users can sign up for the free World Year of Physics newsletter. While many of the media links are currently being constructed, users can find a downloadable poster and logo.

I like this idea. Collecting cosmic ray data would be a good tie
in. When I get back home, I will look deeper into this. Is anyone
else interested?

Perhaps we could help through the UNO Physics Department.

Just to dovetail on Don Pfister's comment, I became a ham PRIMARILY because of balloons in 2001, so anything we can do to include/encourage non-hams is a good thing.

> Space Ballooning" would therefore be more appropriate.

I don't think the hobby would die without Amateur Radio. I think there might well be many more non-hams that would be interested in the hobby. This seems to
me to be a statement "only Hams allowed". I don't think that is a message we want to send. Personally, most of the people that have helped me over the years
have been non-hams!

Aren't the majority of the very students and young people we are reaching out to
non-hams?

Paul, I would suggest, while many of your readers are hams, aren't there also non-hams? I think Amateur Ballooning gives us more opportunities to include others. Probably a benefit to getting companies like Parallax and Nut&Volts to
sponsor us, not to mention others. But then again, people complain because we write for magazines.

I do not understand the drive to put "Amateur Radio" on everything?

OH well. FWIW,
Don

I've been preoccupied, when is Harry's flight? I guess I better check email messages better before the weekend.

> I can't seem to find particulars on the frequencies you plan to use though on

Oh boy, here goes from memory, correct me guys if I mess up. ;-)

Crossband repeater - talk up on 2M 145.56 - listen down on 445.525
ATV - 439.25 verticle
APRS 144.34 gated to findu.com and 144.39
SSTV 147.585

IF the crossband repeater works well early in the flight we may try a test of SSTV through the crossband repeater. That will be announced during the flight. We are trying to schedule the test with some of you distance stations. Would you be willing/able to try a test like that?

We MIGHT also try a test of the IRLP link with the crossband. This is still undecided.

It would be great if we could make contact with you through the balloon! ;-)

Hi Ralph,

I assume that this page hopes to compile the launch announcments
from all of the various bealloon groups whose reflectors you are
signed up on?

If so, that sure would be a great service! Even better if had a
more concise URL :={. What would be even better is a SINGLE email
reflector dedicated to balloon launch announcements w/o any other
chit-chat - it'd have to be moderated, or posting permissions limited
to just a select few in each balloon group. Email is more timely,
since I go a-browsing only once in a blue moon.

Ralph,

The announcement page looks great....I'll point some easy to remember domain names to it (listed below)...For those who want to post a launch announcement on a bulletin board format in addition to emailing Ralph for his page, I also have a link on my pages to do that as well....thanks to Mark N9XTN for trying it out for his last flight.

Also, I agree with Mike about the scattered reflector groups, I'm sure I've missed out on some launch opportunities since I was unaware of the flights unless they were announced on GPSL or Balloon_Sked (the two reflectors to which I am subscribed). Either reflector seems to me a good choice for national email launch announcements since most of the active groups seem to be on them.

The following domain names will have a link to Ralph's Launch Announcement page (take your pick which one is easiest to remember):

http://www.balloonatics.org

http://www.superlaunch.org

http://www.hamballoons.com

http://www.hamradioballoons.com

http://www.gpsl.info

http://www.gpsl.biz

http://www.upintheair.biz

http://www.wb8elk.com

Note that the GPSL and SuperLaunch web domains are also available for use for next's year's GPSL if so desired.

Bill, I didn't get a reply or acknowledgment that you read this. Are you flying a balloon on Sunday too? You mentioned putting a crossband repeater together and fly it Sunday, if you have time.

HARRY, we too will be without a true TNC. We will be flying a Pocket Tracker (TinyTrak III), and Garmin Rino(s). I think the Crossband Repeater might be the only hope. IF Bill can hear the Crossband repeater you could send him a packet through it. It would only be EBE, unless Bill too flys a crossband repeater, but that too might be neat with a crossband repeater rather than a digipeater. IF the two of you are interested in a test of this sort, let me know so we can plan it. Either way be sure to check into the crossband repeater if you have the opportunity. I'm not sure if ORB will be down before we launch at 10 CDT.

Our launch status, equipment, and frequencies are on our http://habitat.netlab.org/launchsite.html page. We have a 40M freq. listed 7253.5 (oops I see it is listed as 40M 7253.5 MHz - I guess I better change that ;-).

Later,
Don

Either reflector seems to me a good choice for national email launch announcements since most of the active groups seem to be on them.

I think we need to somehow promote Balloon_Sked as a national list - it was started for the sole purpose of launch announcements with no chit-chat. The central US groups regularly post, but there's less participation by groups outside the region. Perhaps someone can e-mail contacts for the other groups and (a) let them know of the Balloon_Sked list and (b) encourage them to post their announcements to it.

GPSL was started as a discussion list related to (go figure) the Super Launch, but it's also a good way to touch the key players among several groups.

Bill, once I have a 2005 Super Launch page figured out I'd like to take advantage of the domain name you registered.

I spoke with Mike Larson of UNO after last week's NSTAR BalloonSat launch. He's excited about the possibility of having the Super Launch during the UNO aerospace teachers' workshop in 2005. This would be a non-4th weekend though, probably 22/23 July (Fri/Sat). He also believes he could work our Friday presentations into his lesson plans.

Most groups announce their flights to email lists. I subscribe to all lists I hear about and therefore already know about most flights. It takes very little additional time to periodically (weekly?) scan through web pages for info. It is reasonable to update the page every time a change is required.

I agree, balloon-sked should be used only for announcements.

I can easily copy/paste/post our launch page in HTML format to balloon-sked every time it is changed.

Bill has taken care of easily remembered URLs but users are clicking on links so a long obtuse URL doesn't appear to make much difference.

I volunteer for the chore of inviting all known groups to announce their flights on balloon-sked.

We have a new Amateur Radio high altitude balloon launch announcement service at http://users.crosspaths.net/wallio/ARHAB%20Launch%20Announcements.htm. Additions and changes will be updated almost daily as necessary.

Launch information is also posted to Balloon_Sked@yahoogroups.com. Balloon_Sked-subscribe@yahoogroups.com to subscribe (no subject or text is required).

All high altitude ballooning groups, Amateur Radio, university, et al., are encouraged to submit information to be included in these announcements. As of 31Jul04 we have five flights scheduled to be launched from Tulsa, Kansas City, Denver, Dallas and Houston areas.

The "free" part is not definite, but I'd say it's 98% there. Especially if he can tie it to the teachers' workshop. It may not be as nice as the room at Hutch where we had WiFi and wired Internet. But we should have computer, DVD, and VHS on a projector.

We may have non-free expenses like coffee and so forth. But I believe there are well-stocked vending machines nearby.

Since the workshop is now over I should be able to get with Mike Larson to work out the details for next year. More as I get them from him.

UHF line of site, hundreds of miles.

Ralph you can list the Rino GPS (not the FRS) but the GPS as good above 60,000'. It feed the KC0SSI-11 Open Tracker on 2M yesterday. Unexpectedly he did get it going (thanks to the KS PFranc for the 'rPlug') in time for the flight.

Did you actually have RINO polling working over hundreds of miles? Taking a guess at receive antenna gain (-9dB), receive noise temperature (1000dK) and required demod SNR (24dB), I calculate a maximum line-of-sight range of ~150kM (~90 miles) in an otherwise reasonable situation (e.g., antenna orientation and polarization).

We need your RINO model and software version for our 60kft listing.

From: n9xtn@cox.net
Topic: 983 Message: 983

I've gotten confirmation on the dates for next year's UNO Aerospace Education workshop, so the 2005 Great Plains Super Launch will be held July 22-24, 2005.

Dr Larson is not yet able to officially reserve classroom space for us this far in advance, but it will be no problem to do so and we will have it at no charge. I'm 90% sure this will be held at the UNO campus in Omaha (near 60th and Dodge if you're curious). We might have to go to Iowa Western Community College which is a few miles east of Council Bluffs on US 6.

As usual, presentations will be on Friday and the launch on Saturday, with a backup launch date of Sunday.

If there is sufficient interest, we may be able to organize outings to the Henry Doorly Zoo or the Omaha Children's Museum on Friday for family members who aren't attending the presentations.

Here is our tentative set of launch sites:

Primary launch site (landing 0-180° from launch)
Treynor (IA) High School
N41° 13.87 W95° 36.50
http://www.terraserver.microsoft.com/image.aspx?t=1&s=10&x=1406&y=22838&z=15&w=1

Alternate launch site (landing 180-359° from launch)
Wahoo (NE) High School
N41° 13.50' W96° 37.58'
http://www.terraserver.microsoft.com/image.aspx?t=1&s=10&x=3494&y=22831&z=14&w=1

If the winds are extremely light, we may have to find a launch site farther east than Treynor - bursts lower than 80,000' would land 5-10 mi east of the launch site, while a 100 kft burst would land 5-10 mi west of the launch site.

984. HABITAT SkyLab 7 year anniversary flights 04D 8/21/04 and 04E 9/11/04

Yahoo group: GPSL (2002 — 2008)
Date: 2004-08-07 00:14:32 UTC
From: Don Pfister
Topic: 984 Message: 984

The HABITAT SkyLab group will be working tomorrow on planning for their 7 year anniversary flights. Our "first flight attempt" flight will be 8/21/04 from our Original Launch Site, the Edgerton Park, Edgerton, KS. The detail haven't been worked out yet but this will be a dual flight. The new CAP-N-SPACE group will be joining us for their first flight attempt.

We plan to fly at the Herrington Airport Open House again this year on 9/11/04. Details on that too are being worked out. This will be the 7 year anniversary of our "first successful flight" flight. ;-) This too MAY BE a dual flight with Project Traveler again. They may be tied up with other commitments.

While these flight dates are not the exact dates of our flights 7 years ago, they are correct to month and year. I will update the web pages, and groups as details are confirmed.

We are going to attempt to get as many of the original members to join us as possible.

Thanks,
Don KA0JLF

I was wondering if anyone can help me out here. I was looking for a simple way to predicte the range of given system. I understand the 1.23*sqrt(alt) is the LOS, but the question I have is how does power fit into this picture. It seems to me that a 1W system or less will have a shorter range then a 10W system with every thing else hold constant.

Any help would be great.

Let me know if you are still having problems. I tried it from two
different ISPs, and they both loaded very quickly. Maybe try refresh on
Netscape or clear your history. Sometimes the history/cache files get
very large in Netscape and this can clog up the system.

Subject: RE: South Texas BLT-20 Info

Hi Ralph!

As long as there is one small hole in the clouds that we can squeeze the balloon through, we will have a launch! We went up about 38 minutes late, but that is normal for us. Although we only advertised the "Mode B" repeater with two meters up and 70-cm down, it was bidirectional. There were some potential interference issues, but if the NTBP had not scrubbed, and if they were bi-directional also, we would have moved the 70-cm frequency on our repeater to match theirs and announced the bi-directional capability of our system. Not this time, but it would be fun to try at a future date!

Our flight went VERY well!! The wing glider was released just as the payloads entered the clouds. The TV from the wing glider went from gray nothing to quickly-approaching ground! Then N5RPQ pulled out of the dive and headed for the airport runway. We crossed over Highway 59 (future IH-69) and came in for a smooth landing in the grass just short of the runway - watching the video the whole time.

The main payload continued on to @~83K' with great video, APRS and cross-band repeater activity. After burst the payload floated down to a spot about 100' off of a nice paved county road in a cleared field - only 0.5 miles from our usual post-flight BBQ restaurant!

Absolutely FANTASTIC! I will be updating the website as time allows. I got the "Final Integration Meeting" photos up last night. The 35-mm camera pix show a lot of cloud shots, but I will get them scanned as soon as Pete KD5ELH, our Photo Master, gets them to me.

A good time was had by all! Now we can kick back and play with the cross-band repeater on the NTBP project on September 4th!!!

Subject: Re: South Texas BLT-20 Info

After the NTBP WX scrub I brought up Houston WX radar early Saturday morning and noted thunderstorms in your area. Did you folks fly BLT-20 or did you scrub and announce another date?

I note that both BLT and NTBP are including cross-band voice repeaters, BLT with VHF>UHF and NTBP with UHF>VHF. Given flights at the same time on the same day, frequency coordination might yield some interesting EBBE QSOs with potential distance records.

There have been only two EBBE QSOs to date (see http://users.crosspaths.net/wallio/RECORDS.htm) both far short of maximum distance.

It is tough enough to get one balloon off the ground let alone two with coordinated payloads at the same time. Record distances also require cooperation of ground stations out at the edge of coverage from near maximum altitudes.

Date: 2004-08-31 23:11:16 UTC
From: John - K7JPS
Topic: 999 Message: 999

Treasure Valley Near Space Program Inc (TVNSP Inc) will launch TV04B on Saturday, September 4th at approx 7:15 am MDT (1415 UTC).

The flight will consist of 2 capsules flying under the TVNSP Inc call sign NS7TV-1 and Dan Paulson's callsign KD7OST-11. The balloon will be a 1200 gram Kaysam. The expected burst altitude will be 103,000 feet or more.

The first capsule, NS7TV-1, will be flying an Alinco DJ-S11 with a TT3 and Garmin GPS 35 LV on 144.39 MHz. This capsule will be Jeff's Camera Platform and will also control the cut-away device for the balloon. The capsule will carry a panoramic camera and is programmed to take photos of the balloon, horizon, and the release of the second capsule.

The second capsule, KD7OST-11, which will be the first test of Dan's High Altitude/Low Opening Freefall (HALO) recovery system (Project Icarus) will also be flying a Alinco DJ-S11 with a TT3 with a Gecko GPS also on 144.39 MHz. This is likely to be the first and only flight of this hardware configuration. We hope to implement this recovery technology into most if not all of our future capsules.

This flight will have a single launch with separate recoveries for the two capsules. The release capsule will be cut away upon a command from the ground and will freefall to 20k where it will deploy it's parachute and enter a normal recovery mode.

Photos of both of the capsules can be found at http://www.tvnsp.org/modules.php?name=Gallery.

The launch point is yet to be determined. Landing of both capsules will be along the Owyhee front.

1004. HABITAT SkyLab HS04E flight SSTV pictures - slideshow

Yahoo group: GPSL (2002 — 2008)
Date: 2004-09-21 01:58:27 UTC
From: Don Pfister
Topic: 1004 Message: 1004

I have created little slideshows for each of the SSTV pictures captured by the following people:

http://www.habitatskylab.org/HS04E/IMAGES/SSTV/W0RPK/ - Ralph in Iowa
http://www.habitatskylab.org/HS04E/IMAGES/SSTV/W0JRT/ - Jerome in Lenexa, KS
http://www.habitatskylab.org/HS04E/IMAGES/SSTV/N4BM/ - Bob in Wichita, KS
http://www.habitatskylab.org/HS04E/IMAGES/SSTV/KA5YFC/ - Steve, mobile chase team
http://www.habitatskylab.org/HS04E/IMAGES/SSTV/KA0JLF/ - Don, mobile chase team

Steve, KA5YFC, got the most pictures. He has several from before the launch at the airport, and some at the landing.

I find it interesting to see the pictures captured from all the locations. I'm not sure of the distance for each station but some are a hundred miles or more, I think. Thanks to everyone that captured the SSTV pictures and sent them too me.

Just an attempt to let you know about the balloon flight in the morning.
9/26/04 10:30 a.m. CDT from Edgerton, KS

We hope to get to about 90,000 feet so there should be a range of about 500
miles in all directions.

The 2M RDF locator beacon will have a horizontal antenna.

Let me know if you hear anything. You should be able to see where it is at on
the web at findu.com see links below.

Pictures from the balloons should be received every 3 minutes. You can check our
web site for SSTV picture slideshows from previous flight at habitatskylab.org.

Hi Don,

We took off at 10:40 CDT from Harvey Young on the east side of Tulsa in a Cessna 180 and flew to Grand Lake Regional at an altitude between 2k & 3k. I listened for the simplex repeater and the RDF beacon. NO JOY!

Sorry!

No problem Harry. We had checkins on the Simplex repeater from KS, NE, IA as far as I remember.

Guy in Wichita, KS captured 20 SSTV pictures, they are online at http://fmsstv.net/sp/index.html until the next special event that over writes them. About the last two show the runways at New Century Airport.

Thanks for the report! More later, 73

1010. manual for Canon Elph LT camera?

Yahoo group: GPSL (2002 — 2008)
Date: 2004-09-29 23:52:53 UTC
From: Don Pfister
Topic: 1010 Message: 1010

I bought a Canon Elph LT camera at Best Buy last night. It seems to work fine, but it was an open item and no manual.

Do any of you have a manual that could pass along any points of operation that might not be obvious?

The specs on the web says it is suppose to impose the date/time on the film but didn't. I have the date/time set but am not sure how to set the camera to super impose it on the photo.

I quickly took a roll of film and had it processed today. Seems to be ok.

Thanks,
Don

Press the "Date" button on the back of the camera until DATE shows in the display. You have the choice of 2 formats: day/time or year/month/day - keep pressing unti the right one comes up. The information is not burned onto the negative, but instead is recorded on a magnetic strip in the cassette I believe.

However, the photofinisher software doesn't always follow the coding. At Wal-Mart, it always gave me the YMD format on the photo itself. However, the recorded year/month/day/time was always printed on the back.

Thanks Mark, I had/have it set so Day hh:mm 'Date' shows in the LCD but didn't show up on the photos. Hmm... There isn't a date on the back of the prints either. Do I have to request it be printed?

OH, well now I remember, I guess I didn't hit the set/select buttons enought because the colon was still blinking and the time didn't update. At lunch yesterday Larry and I looked at the camera and processed film. We figured out the flashing colon was why the time hadn't updated. I think we hit one of the buttons another time and then the time started updating.

Isn't that the kind of camera you used for a while Mark?

Yes, it's the same kind I've flown for about 2 years now.

I've never had to ask for the date/time to be printed.

1014. Last Weekend's ISU Flight

Yahoo group: GPSL (2002 — 2008)
Date: 2004-10-05 14:11:26 UTC
From: paul.verhage@boiseschools.org
Topic: 1014 Message: 1014
Attachments: 2 described; binary payloads are missing from this source WARC

Here's an update on the ISU launch last weekend. It was the best flight I've seen in Idaho. No surface winds and a 20 mile flight that landed a few hundred feet from the road in a plowed farm field. There were well placed roads for the entire flight. we spent lots of time with the farmer of the property we launched from and at a truck stop showing visitors the balloon and the UI View map.

I ran out into the field as the balloon landed and missed grabbing it by about 3 feet. The plowed field was uneven and I couldn't change my running direction fast enough without tripping. I'll email a few photos when I get them from ISU. I'm attaching a spreadsheet of the science data my flight collected.

Another topic. BalloonSats are popular with college students. The University of Idaho recommends using the plastic tube of a ball point pen to run the load line through. ISU says they saw metal pipe (from lamps) being used at Boulder. We lost three BalloonSats when the metal tube of one BalloonSats abradied the load line. I recommend using plastic tubing from hobby shops for the loal line and three cord suspension system. I'll post photos of the design shortly. I would also recommend using 1/2" thick styrofoam in place of the foam core. I'll write up an article on this for Nuts and Volts for early next year. I'm planning on getting Boise School District students to make a bunch of BalloonSats for launch.

Paul

Very cool. We haven't quite been able to do that here yet, though we have had good luck being within a couple hundred yards as the payloads come down.

For the UNO BalloonSat flight, I believe the students used plastic tubing used to run water to things like ice makers in refrigerators, etc. Easily obtained from a hardware or home improvement store. To keep the tubing from sliding through the cube, a metal retaining clip (looks like a "C" with flanges that grip the tube) was placed on both sides of the cube. This worked pretty well for us. The tube was flexible enough to keep the line from abrading. We also put a separate line from the top tracking payload to the bottom one so that if one of the BalloonSats did cut the load line, the tracking payloads would remain tied together. There were no cameras in our BalloonSats so there were no issues with obscuring their view with another line.

Has there been an issue with foam core satellites? I think foam core mount board would be a lot easier for the students to cut cleanly than styrofoam.

>
> Has there been an issue with foam core satellites? I think foam core mount board would be a lot easier for the students to cut cleanly than styrofoam.

I'm using a polystyrene tube (3/8" diameter, I believe) for my BalloonSat tube. The tube is manufactured straight. I can hot glue it to the 1/2" styrofoam BalloonSat.

I'm using 1/2" foam because it will be warmer and I believe easier to machine. As long as I use a sharp exacto knife, I get clean cuts on the foam. The BalloonSat should be stronger in foam than foamcore. I'll have some students make strenght tests on the stuff in the next week. Also, the BalloonSat will be more protected from water damage.

I coat my BalloonSat with Uline tape, a tape made for styrofoam gliders. It comes in a variety of colors and is very lightweight. Especially when you compare it to the aluminum tape used on some BalloonSats. With uline tape and 1/2" foam, I believe my BalloonSat airframe is lighter.

I'll have my students run some tests and report back the results.

On using a three line suspension...
Using the single line suspension risks abrading the line and dropping the lower BalloonSats, which is how my BalloonSat was lost. There are alternatives, as Mark said. But if you use a three line suspension, you also reduce the rocking and spinning experienced by the BalloonSats. The photos should be crisper as a result. The reduced rocking and spinning also cuts down on the abrasion.

Paul

Our students used what appeared to be colored duct tape, but we weren't as concerned about weight. Is the Uline tape available at hobby stores?

Can you describe (or post a photo) of your three-line suspension?

- Mark

> Our students used what appeared to be colored duct tape, but we weren't as concerned about weight. Is the Uline tape available at hobby stores?

It is. HobbyTown in boise has part of a wall dedicated to the stuff. It's a very thin tape.

> Can you describe (or post a photo) of your three-line suspension?

I'm working on it between classes. It's basically a spreader ring for a parachute, but flipped upside down. I started with a bearing swivel and tied three 50 pound test spectra lines to it and sealed the knots in heat shrink tubing. I took a 6" diameter needle point ring and drilled three equally spaced holes in it. The lines from the bearing swivel drop through the needle point loop. I slid a bead on each line and then tied a large knot in the spectra. The knots keep the beads from sliding any farther down and the beads keep the needle point ring from sliding down. I'm now working on tying bearing swivels every 18 inches.

A BalloonSat needs to have three tubes glued into it. The styrene tubes I'm using are very light weight. I cut grooves into the foam body of the BalloonSat for each tube before I assemble it. To make the grooves, I sharpened up a plastic tube and twisted it into the foam to cut a cylinderical groove the correct diameter. I also cut smaller diameter holes in the foam for 3/16" wooden dowel. The dowels protrude from the BalloonSat by about 3/4" so I can rubber band the hatch on the BalloonSat.

After hot gluing the BalloonSat together, I cover it in tape (I used black for thermal concerns) and then punch out the holes in tape covering the BalloonSat airframe. Then I hot glue the tubes and dowels into place. I'm also making tape labels with my name and phone number.

To fly the BalloonSats, I connect the swivel in the suspension to the bottom of the last module in the near spacecraft. The three lines from the suspension are dropped through the plastic tubes of each BalloonSat and the BalloonSats are pushed up to the level of a bearing swivel. I'll then run a jump ring through the bearing swivel so the BalloonSat can't slide off.

I'll get a digital photo and send it this week.

Paul

Hi Mark,

Congrats on a near-bushel-basket recovery!

Not sure whose email from U. Idaho that you were quoting (Paul V?), but I ran a post-mortem on the line that separated above the six bottom payloads on EOSS-81. The line separated in the middle of the 2-ft open span between the knots separating the the two adjacent payloads. This span could never have come in contact with the ends of the thru tubes; so
it appears that the 240# tensile dacron line separated due to excessive tension during post-burst chaos.

Note that some of the separated payload housings had the aerodynamic characterisitics of a shoe box, thus exacerbating post-burst chaos. On most flights, we put a streamlined (fast-falling) beacon at the bottom. but on this one, I foolishly decided to move the beacon up the payload line and to let someone else's box take the parachute drag drubbing.

EOSS has used this method successfully on many payloads, and we use threaded plastic dress caps drilled thru to prevent abrasion. Mating nuts make interior access to the clamshell housings fast and easy.

We have also seen a number of student payloads using less robust attachments arrive at the recovery site with nothing but a plastic thru tube left on the line. The payload housing must be secured firmly to the thru tube, as this is all that is keeping it from solo flight.

One EOSS payload uses a 0.38" diameter HDPE toilet fill tube as the thru tube. This tube has a molded-in flange at one end that provides a large-area surface to support the bottom of the housing. But it's very had to cut decent threads into this material to accept a nylon nut agt the top. I finally got it right using a very sharp lathe tool and the single-point threading method.

Building-grade styofoam board can be useful for payload housings, but it is difficult to make precise cavities into, and nearly impossible to seal the air gap between the housing and a removable cover. And it doesn't tolerate a rough parachute drag without leaving gouged-off bits behind. The EOSS CW/cutdown beacon foamcore housing has endured well over 20 flights and recoveries; altho it's a bit "cosmetically compromised" from all the landing dings, it's still quite functional. Those poster paper shear layers are surprisingly robust, especially when treated with a couple of thin coats of Krylon.

EOSS's first two Shuttles used a four-cord bridle attached to the corners and tied off a few feet above and below the housing. Although

this scheme does support the package well while conferring some
reducdancy, it also translates line tension into radial crushing forces
that the walls of the housing must withstand. One Shuttle had to be
re-built after a flight where it supported a 50# USAFA at the bottom
of the line. And that flight did not incur post-burst chaos.
The thru-tube method completely isolates the payload structure from the
line tension, and that was our purpose in developing it.

> For the UNO BalloonSat flight, I believe the students used plastic tubing used to run water to things like ice makers in refrigerators, etc. Easily obtained from a hardware or home improvement store. To keep the tubing from sliding through the cube, a metal retaining clip (looks like a "C" with flanges that grip the tube) was placed on both sides of the cube. This worked pretty well for us. The tube was flexible enough to keep the line from abrading. We also put a separate line from the top tracking payload to the bottom one so that if one of the BalloonSats did cut the load line, the tracking payloads would remain tied together. There were no cameras in our BalloonSats so there were no issues with obscuring their view with another line.

I've been using the 1/2" styrofoam on capsules in the past, and now with the BalloonSats. I suppose that if the edges had to be absolutely square, then a hot wire cutter or small table saw is the way to go. I find that just cutting it with a straight edge is good enough. A little hot glue can fill the resulting gaps. With the 1/2" foam and the fact that these are BalloonSats with limited weight, the compression forces seem to be insignificant. I can image a very wide BalloonSat would have an issue, but keeping them to 500 grams (or 400 grams here in Idaho), would seem to preclude particulary wide BalloonSat airframes.

The flight in Idaho this week looked like a line cut by a metal pipe. The end of the line was frayed at about where I would expect the pipe to do it. All it takes is a single BalloonSat to cut a line to doom the BalloonSats below. The three line suspension I'm building will keep the twisting and rocking to a minumum and prevent the abraided line. And it includes redundancy. The BalloonSats are free to move around a bit on the suspension lines, but their movement is restricted.

I'm attaching images of the harness I made yesterday, along with two images of BalloonSats that I assembled.

In the next week I'll plan to run a strength and temperature test. I'll let you know what I find. I'll also write something up for Nuts and Volts.

I have made a traditional BalloonSat for comparison to my modifications. Here's what I have so far.

I measured the weight of a 5" by 5" sheet of foamcore (3/16" thick) and of a 5" by 5" sheet of 1/2" (actually 9/16" thick) styrofoam. My digital scale measures to a precision of 2 grams. The foamcore weighs 10 grams and the 1/2" styrofoam weighs 8 grams. The bare 5" cube BalloonSat in foamcore weighs 58 grams and weighs 82 grams with a minumum covering of aluminum tape (which is what I saw U of I and CU Boulder students use). The 5" cube BalloonSat made from 1/2" styrofoam weighs 62 grams complete, including the suspension tubes, dowels for locking the hatch on, and Uline tape.

I plan to make two more tests this weekend. I cut 20" long by 2" wide strips of both materials. I plan to use them to measure the breaking strength of both materials. I'l also measure temperatures inside both 5" cubic BalloonSats. The styrofoam is about 2-1/2 times thicker, so I expect its R value to be 2-1/2 times greater. I'm not sure how the black tape on the styrofoam and the aluminum tape on the foamcore boxes will modify that.

Hi Paul,

I use a thin coat of dayglo orange Krylon on the external foamcore surfaces - mush lighter than Al duct tape. If shielding is needed, I use kitchen-grade Al foil inside where it's needed, bonded using Elmer's glue. The Al tape's adhesive is not electrically conductive, but pinpricks into the Al foil seams form solid electrical bonds.

A high R-value is a good news / bad news issue. If there's power dissipation inside, the poor convective heat transfer of low-density air at altitude can result in overheating!

BTW, other than using a built-up method with 1/2" foam sheet, how do you get precise cavity bottoms in the foam using an Xacto knife?

The BalloonSats were launchiong only carry Hobo data loggers and cameras, so heat is not an issue. There's a large enough hole for the camera lens, that I imagine that it will keep temperatures under control. Since the weight of the BalloonSat is so low, I can't imagine a powerful payload inside. We're limited to 400 grams in Idaho.

> BTW, other than using a built-up method with 1/2" foam sheet, how do
> you get precise cavity bottoms in the foam using an Xacto knife?

I glued up a pallet that slide into a pocket in the BalloonSat. The pocket was made by gluing a sheet of styrofoam into the cube of the BalloonSat. For large spaces, I'm going to recommend using a few styrofoam peanuts as a space filler.

I continue to have very good luck with Digikey in Minnesota. I can order on Sunday evening, and have it in hand (Kansas) by Wednesday morning via ground shipping. My shipping totals are usually in the $3.00 range for most orders.

They do have a ?$25? minimum order, but who can visit a candy store and not spend twenty bucks?

Just my two cents...

As requested by the Johnson County Radio Amateurs Club, after their auction today, we launched another balloon flight from the Marshall Ensor Farm Museum (http://www.w9bsp-w9ua.org/ and http://kansasdar.org/olathe/Ensor.html). Due to the high ground winds, we launched a 350 gram balloon between 1 and 1:30 p.m.

It landed E of Lone Jack, MO about 45 ft. across 3 trees. After much work (several scrapes, sticks and other fun with stickers, thorns and tree bark - not to mention the laughter pains) we got all three packages and the parachute down.

As I remember our max altitude was around 42,000 ft. Our max speed was around 92 mph.

Personally, I had my hands full and didn't get any photos. As photos become available I'll post them to the web site(s).

Today was a first for us, in that, we had as many Rino trackers as we did APRS trackers. The Rinos sure make ground recovery very nice. With the Rino 120 on sale at Best Buy, it makes a very handy GPS receiver, with graphic map/display, and the FRS is just icing on the cake. ;-) A simple serial cable can tie into a D7/D700 or PC (or TNC) for GPS output, giving both Rino and APRS.

More info tomorrow,

I have a DeLorme Tripmate for sale for $30 postpaid. The unit has been modified to self-start as shown at http://wes.johnston.net/aprs/tripmate.htm .

With the jumper in place, the unit will run off 5-6V put on pin 9 of the serial plug. Or, the jumper can be disconnected and the unit will operate off 4 AA batteries for around 8-10 hours.

Prior to the modification, I had programmed the unit to turn off some of the GPS sentences to reduce the serial data going to my BS2SX I was using at the time for a balloon payload. The sentences enabled are GPGGA, GPRMC, and GPGSA. The main on you don't have is GPGSV, which shows the location of the GPS satellites in the sky and is not used for normal APRS work. I powered on the unit today and it's working fine.

Not quite the answer you're looking for....

I use Ares Lite by Labcenter electronics. It allows me to create a mask of the baord that I can shoot on my UV table. I then make my own boards. Ares is free for the 100 pin or fewer version.

I can design a board if you send me the scheamtic.

Paul (who is shooting boards with his class today)

> Apoligies if you get copies from all four lists.....
>
> I've been poking around some websites for info on PCB layout software and companies that will manufacture boards for you based on Gerber or other file types. I'm looking for free software as I doubt I'll get into this far enough to make it worthwhile to pay much for it. Also, reports on your
experience with board houses (good or bad) is appreciated.

My recommendations:

Board houses:
www.expresspcb.com

- They have a free PCB schematic capture and a free PCB layout program that works pretty well....$51 for 3 fixed sized boards.

Advanced Circuits www.4pcb.com

Excellent quality but on the expensive side

AP Circuits - www.apcircuits.com

- Nice quality and very fast and reasonable but you have to sand down the rough edges on the board.

PCB layout programs:

IVEX - get it before they go out of business...have a couple of nice specials now

Eagle

Schematic capture:

DesignWorks Pro...my favorite

I've used Eagle CadSoft for a large number of projects:

http://www.cadsoftusa.com/

They offer a Windoze and Linux based tool. Freeware, Non-Profit, and commercial versions available. The freeware version is exactly the same as the full version, you are just limited to 2 layer boards of a certain size. No time limits. Great parts library. I also have a parts library that includes a number of components related to ballooning:

http://www.kd7lmo.net/tech_pcb_tools.html

For board houses, I like:

http://www.pcbfabexpress.com/

Very good quality and reasonable prices. Just e-mail them your Gerber files and you'll get back nice looking boards.

If you want to do the boards in your garage, here is a step-by-step guide:

http://www.kd7lmo.net/tech_pcb.html

1046. PCB design software and board houses

Yahoo group: GPSL (2002 — 2008)
Date: 2004-11-09 19:18:36 UTC
From: n9xtn@cox.net
Topic: 1046 Message: 1046

I replied to some of you regarding a couple of PCB manufacturers yesterday. Some of my confusion came from two places with similar sounding names and similar pricing for small quantities. www.expresspcb.com is what most of you mentioned. I got that mixed up with www.pcbexpress.com, which is linked with pcb123.com.

From looking over the websites some of you gave me, I think the best software for my purpose is either the ExpressPCB software/schematic capture (tied to ExpressPCB board ordering, or extra $$ to export a Gerber file) or the Cadsoft Eagle software (freeware version is fully functional for boards less than 80x100 mm). Have not yet tried either one.

Board houses with the best deals for small quantities are www.expresspcb.com and www.pcfabexpress.com. The former looks to be very fast if you can work on a fixed board size, while the latter offers more flexibility at competitive prices if you can wait a few days.

Thanks to everyone for their inputs!

Hi Mark,

I use perfboard for all my onesy balloon payload stuff. Much faster
and cheaper than going PC board, and a whole lot easier to modify.
For RF and noisy or sensitive stuff, I use the raw clad G-10 and
Dremel method.

Now, if I were faced with making more than a few of the things, then
I'd go the PCB route. But that ain't happened yet ...

Hi James,

Sorry to hear about yer losing a one-on-one with Ma Nature. Been there. EOSS's launch scrub criterion for any balloon is 10 kt, and 5 kt for a plastic balloon. If a plastic balloon even touches the ground during fill, kiss it off.

We've sorely regretted the times when we've dared to violate that criterion. That's why we try to launch as close to sunrise as possible.

Date: 2004-11-12 18:57:17 UTC
From: n9xtn@cox.net
Topic: 1049 Message: 1049

I got the following from the READY mailing list:

A total power shutdown (outage) at our NOAA offices is planned for Saturday, 20 November, beginning at 0800L and lasting 10 to 12 hours. This outage is to allow for mandatory maintenance on building systems. ARL will be turning off all computers (including the READY webserver) at the end of the business day on Friday, 19 November. If possible, the servers will be restored on Sunday, 21 November, otherwise they will become available at the beginning of the business day on Monday, 22 November.

==========

Those of you pulling wind forecast data from this site will want to get your data this afternoon before around 4pm EST.

Thanks for that head's up, Tim! I has assumed that the prohibition on cell phones aboard commercial aircraft had to do with EMC issues with comm/nav systems. No idea that it extended to ALL airborne vehicles, private and unmanned included.

I do rather doubt that it has to do with hitting multiple cell sites from high altitude, however. This is more than likely a billing issue for the user; e.g., the US Army High Altitude Research Lab on the 14,250 ft summit of Pike's Peak, overlooking the city of Colorado Springs, was having some budget problems due to excessive roving charges when cell sites in Denver, Pueblo and Park County pick up their calls. Once a cell site has acquired a cell phone call, all the others that hear it ignore it.

The Feds have never been terribly forthcoming with rationale behind the published rulings. It takes a poring over of the Federal Register to glean any such info. But as stated, it appears that high-altitude cell phone payloads are a no-no.

I've cc'ed some private pilots who have worked with EOSS to see if their take on this is so Draconian.

1051. GPSL 2005 date change

Yahoo group: GPSL (2002 — 2008)
Date: 2004-12-06 02:59:05 UTC
From: Mark Conner
Topic: 1051 Message: 1051

Hi everyone,

A bit of good news for me and my family, but it impacts the balloon flying next summer. Shari and I are expecting our second child next July. Near as we can tell now, the due date is near or just after the currently-scheduled GPSL weekend (July 22-24).

The latest weekend I'd feel comfortable with playing host to the GPSL here in Omaha is 4th of July weekend. We could have the symposium on Saturday, fly Sunday, with a backup fly date of Monday the 4th to minimize vacation days for people. Friday-Saturday-Sunday (1-3rd) is also OK. The previous weekend (June 24-26) is Field Day, so I don't suppose many will want to coincide with that. I'm also open to other dates like Memorial Day weekend.

This also means we won't be able to participate with the UNO Aerospace Education Workshop, as I believe they start July 11 or 18. I don't know yet what that will do with Dr. Larson's ability to obtain classroom space for us. With two other community colleges in the area I think we can get something for little or no cost.

For those groups planning to attend, please let me know your preferences on dates. I believe most of you preferred the July 4th weekend if we didn't have the tie-in with UNO. We can also arrange some alternate activities for spouses and children (zoo, Children's Museum, etc.) on the day of the symposium if some would like that.

I will update our website (www.superlaunch.org) with the new info once we decide on the date.

Hi Mark,

Well, I guess early congratulations are in order! Unfortunately, June and July are jam-packed as usual for EOSS. We have Space Grant flights scheduled for July 2/3 and July 16/17, and the MS-150 special event ties many of us up July 9/10. June 11/12 is another SGC flight, and I'll be overseas for that one, plus 6/18-19. FD is 6/25 and Dayton is 5/21-22.

So the only nearby dates before July 4th that we have open are June 4/5 and May 28/29. And I've not solicited the membership regarding what plans may already be in place those weekends.

Keep me posted - if EOSS can't make GPSL '05, then I'd like to know early on to put some flex in our SGC flight schedule for weather.

1060. Controlled float of a latex flight

Yahoo group: GPSL (2002 — 2008)
Date: 2004-12-11 17:06:24 UTC
From: Ralph Wallio, W0RPK
Topic: 1060 Message: 1060

QSYing this round table to GPSL for a wider discussion ...

Responding to Mark's discussion of the potential of 12-18hr flights, I have a scheme that appears to work every time ... when flown as a thought experiment. Mileage for others may vary significantly. Think through this step by step to get a feel for how a controlled float can happen.

The configuration uses two balloons, a "MAIN" and a "BOOSTER". The MAIN is filled for close to equilibrium when loaded with payload but erroring toward very slightly negative lift. The BOOSTER is filled for a reasonable ascent rate. After launch and ascent to ~80kft, the BOOSTER is cut away leaving only the MAIN and payload which will be close to floating equilibrium.

At 80kft there is a +/-20kft buffer between MAIN burst at ~100kft and controlled airspace at 60kft. The BOOSTER only has enough lift to yield a reasonable ascent rate so it will not be close to burst at 80kft. Similarly, the MAIN only has enough lift for equilibrium so it will not burst unless it goes well above 100kft (we are talking about a 1500-2000g MAIN and 600-1000g BOOSTER depending on payload weight).

This configuration should be launched at dusk so there is no additional lift due to solar heating. With no loss of solar heating during the first 24hrs the only loss of lift from the MAIN will be gas migration through latex. This loss of lift will need to be offset by occasional ballast dumps. My alleged calculations show a 6-pound payload needs to include only ~16oz of dumped ballast to compensate for a significant cumulative loss of lift.

There will probably be some minor lift trimming shortly after the BOOSTER is cut away but the flight should be stable through the night. Then, roughly 12hrs later, sunrise will yield solar heating lift which will approximately offset loss of lift due to gas migration. Ballast dumping, an ounce at a time, can be used to control slow descent but only when approaching 60kft. Save that ballast.

Now we are at 24hrs and sunset. Loss of solar heating will slightly reduce lift so ballast will probably have to be dumped over night. How much? This is where your mileage may vary. Assuming altitude can be kept above 60kft the flight will last at least until sunrise some 36hrs after launch.

Now it is time to get real about crew fatigue. Crew shifts, say 4hrs, will be required to continuously monitor the flight and issue ballast dumping commands. All manner of things could go wrong so the chase/recovery crew will have to be ready to scramble through both nights (the proverbial "hot standby"). With sunrise on the 2nd morning crews will negotiate a time for flight termination. A MAIN cutdown command will be issued accordingly. Flight time of 40hrs seems reasonable for a 2-day weekend.

You want to go 3 days, another 24hrs? There may be enough ballast left to keep the flight above 60kft through another day and night. Regardless, the game is over when you have run out of ballast and can no longer keep the flight above 60kft.

Piece of cake, or in intelligence speak, a "slam dunk". So when to do this(?) Winds aloft in May and September have statistical advantage according to Mean Zonal Winds because during these months wind velocity 60-100kft approaches zero. There will be a little drift during ascent and descent but MAIN and payload will station-keep nicely while floating for the vast majority of the flight.

Payload design will have to include enough power for 48 (72?) hours. Bill Brown's 0.72-pound floater was designed and tested to stay on the air for 72+hrs so we know it can be done. My response to this in Solar Floater was to design and fabricate a solar charging system. I haven't made progress for a couple of years so I hope others take on the challenge.

We've experimented with this concept a little. We were successfully
able to glue an eye-bolt to the top of the "MAIN" balloon and attach the
"BOOSTER" above. That worked well.

The problem with our flight was that we were only using a 100g "BOOSTER"
and it didn't have enough net lift to provide a significant impact to
the system, in fact it was quite the opposite. In other words, the 600g
"MAIN" literally drug the "BOOSTER" behind it to altitude.

What kind of glue? For a duration flight, it would seem the glue would affect the balloon's longevity.

I wonder if the "booster" could be flown right next to the main? I'm not sure which is worse - a load line rubbing on the balloon, or two balloons rubbing each other?

I'm working on collecting parts for a short-distance remotely-controlled cutdown. The remote TX would be in the main payload, and the RX in the cutdown box. The BS2 (or other control mechanism) would then activate the cutdown. The "design" I have in mind can support two latches easily (4 with a bit more effort), and these could be hooked to separate NiCr wires to cut away either balloon as desired.

I need to look some pictures from GPSL 2004 to see how Don arranged his balloons. He's flying a balloon right now, BTW (KA0JLF-11, simplex rptr on 145.555).

Regarding balloons bouncing off of each other, see the image at http://www.amrad.pt/lancamento_cinelsat2.php. This configuration flew for 15hrs+ (15hrs is all they could document but the flight lasted a lot longer) and is currently #1.

I'm copying Don's repeater very roughly on a discone in the attic here in Hutchinson, KS.

The glue was some 3M stuff that was kind of tricky to get a hold of. We found some stuff that worked that the maintenance ddepartment at the airport was using for gluing weather stripping on airplane door seals. The glue remained pliable and was kind of interesting to work with.

As for cutdowns, remotely controlled RF cutdowns are the only way to go. We've flown our cutdown on several flights now using a Linx transmitter/receiver pair. The latest version of the board which hasn't yet flown uses two NiCh wires which are independently powered and controlled via a single uP. One of the wires is controlled via the RF link. The second wire is based on a timer (x minutes after power being applied to the uP). The whole system is powered from three lithium batteries - a coin cell for the uP, and one camera battery for each hotwire.

The uP waits for a specific series of digital pulses from the receiver. The main payload sends the cutdown command for about 1 second every 30 seconds for the duration once it's decided it wants to terminate flight. Termination logic can be based on anything you want - battery voltage, IAT, ascent rate, altitude, etc.

The camera batteries are mounted in battery holders (soldering to those batteries sucks). I'm using a low-voltage FET transistor for the driving force.

I also put a small piezo buzzer parallel across each of the hot wires. There's just enough voltage there to make some noise, and it provides an early warning (okay, about 2 seconds) if a cutter should fire while on the ground.

1065. GPSL 2005

Yahoo group: GPSL (2002 — 2008)
Date: 2004-12-11 23:21:02 UTC
From: Mark Conner
Topic: 839 Message: 1065

I think we're down to one of the three summer holiday weekends for our new GPSL 2005 date - Memorial Day, 4th of July, or Labor Day. I'm a little partial to 4th of July since that is the "traditional" weekend for GPSL, but I'm open to the other two.

EOSS already has a Space Grant flight scheduled for 4th of July, so they will be unable to participate directly. I'm hoping that flight could support a digipeater for APRS EBBE - at least that way they could participate remotely (as NSTAR did for GPSL 2003).

1066. Re: [GPSL] Controlled float of a latex flight

Yahoo group: GPSL (2002 — 2008)
Date: 2004-12-13 03:57:56 UTC
From: Mike Manes
Topic: 1060 Message: 1066

Hi Ralph,

WE've tried pairs of balloons in order to achieve a controlled, moderate descent rate. Theoretically, the "ballast" balloon would also serve as a variable drag area "ballchute" to yield a near-constant descent rate.

Our results were less than successful. One problem was that if the two lift lines were attached to the the apex of the 'chute where the cutters reside, they'ed get terminally twisted during ascent, thus averting cutaway of the "lift" balloon. The second was premature bursting of the "ballast: balloon(s), presumably from friction on the "lift" balloon line. The latter was cured by running both balloons next to each other, but that didn't affect the twisting problem.

Finally, altho latex balloons are certainly cheaper than plastics, when one factors in the cost of a 24hr to several day chase and the risk of loss of the entire payload string, plus the risk of the whole experiment ending up as a derelict in civil airspace, why not simply do a zero-pressure plastic? That's what the pros use. To make multiday flights, ballast must be dumped to compensate for He lost during the day due to solar heating - again, following how manned gas balloons operate.

NOAA has successfully acheived a constant descent rate from 10 mbar using a 4" diameter dump valve as the nozzle on a 3000 gm latex carrying a 6-lb vaporsonde plus a 1-lb chute and cutdown controller. EOSS tried this scheme once, but the bag blew early, and the control cable to the vave operator at the bottom of the balloon got severely twisted in the lift line and broke.

I'm not opposed to innovation in this field, but I'd urge us to take a look

at the experience and science already out there.

I would love to go on a chase like this. Would a Memorial Day weekend be the ideal time?

1068. Re: [GPSL] Controlled float of a latex flight

Yahoo group: GPSL (2002 — 2008)
Date: 2004-12-13 16:45:54 UTC
From: Ralph Wallio, W0RPK
Topic: 1060 Message: 1068

Regarding use of "BALLAST" or "BALLCHUTE" balloons (Mike's terms), ISGC/ISU/HABET has flown a few successful missions using three balloons. Lift from a larger MAIN (my term) is supplemented by lift from two much smaller PIBAL balloons.

One smaller balloon is cut away at desired float altitude (15kft in their case). After science objectives are complete they cut away the second smaller balloon so, with negative lift, the MAIN, payload and parachute slowly descend to touchdown. They cut away the MAIN as necessary to limit track distance.

See discussion and pictures starting at http://cosmos.ssol.iastate.edu/HABET/h43/h43.html. Note that both small balloons are tied off substantially lower than the MAIN.

ISGC/ISU/HABET has been repeatedly successful with this configuration but their desired float altitude was only 15kft. I assume our collective desire would be to float at a much higher altitude, ~80kft as previously discussed. Depending on payload weight, our MAIN could be 1500-2000g and BOOSTER could be 600-1000g. This is not a BALLAST or BALLCHUTE configuration. We would be cutting away the MAIN to terminate flight and descending with a parachute.

Now on to Mike's discussion, point by point:

Cost of Plastic vs. latex:

Latex balloons are much cheaper than plastic balloons in at least three ways. First, plastic balloons, especially plastic balloons equipped for Zero-Pressure flight, cost much more than latex balloons with equivalent lift. A single Z-P balloon will cost almost 10x what a MAIN and BOOSTER would cost. This higher cost is partially because of much higher costs for fabrication material and labor and partially because Raven Industries' Engineered Film Division has no competition to beat. See http://www.ravenind.com/RavenCorporate/eng_films/high_alt_balloons_index.htm.

Second, Engineered Film will not sell Z-P plastic balloons to groups who have not demonstrated proficiency with plastic sounding balloons. I discuss this requirement, as stated by Mike Smith, in http://users.crosspaths.net/~wallio/Polyethylene.html. A group with no previous experience will have to purchase and fly multiple very expensive plastic sounding balloons before they are eligible to purchase an even more expensive Z-Ps.

Third, again as stated by Mike Smith, Engineered Film will require this group to acquire substantial liability insurance specific to flight of their plastic balloons. This insurance is available but at very high cost,

$1,500-2,000 when I gathered information for the discussion.

So the cost of flying plastic is substantially higher than flying latex. We have the equipment, methods and experience that would directly apply to a latex MAIN and BOOSTER configuration.

Twenty-four hour + chase:

Mean Zonal Winds tells us a long chase would not be required in May and September. A short chase of only a few 10's of miles would start only when the flight is terminated. At float altitude, 60-100kft, there would be very little movement. See http://users.crosspaths.net/~wallio/SF_MZW_12mo.gif to see what Mean Zonal Winds predicts for all 12 months of the year.

These May and September opportunities extend roughly a half month before and after, e.g., mid-April to min-June, but we have to wait for the right day. These are MEAN Zonal Winds. Actual winds on any given day could vary substantially from the mean. Deciding to fly a floater on a specific weekend, e.g. Memorial Day, will require us to accept the reality of winds aloft on that day (as well as surface wind, thunderstorms, et al.). Regardless, the chase will be short (but the chase crew needs to be on hot-standby during the entire flight).

Derelict in controlled airspace:

Flight termination mechanisms have to work regardless of whether we are cutting away a latex MAIN or zipping open (or inverting) a plastic Z-P. Either configuration could end up being derelict below 60kft in controlled airspace if our stuff fails. If we want to float a payload we have to accept the responsibility of using line cutters/burners that will work, probably with redundant methods.

NOAA's dump valve:

Their dump valve works but their goal is very different from ours. NOAA wants to descend very slowly which requires reduction of lift by controlled dumping of lifting gas.

Our goal is to ascend, float for 12-72hrs and reliably terminate flight. We have a great deal of collective successful experience ascending and terminating. What we are adding is a second latex balloon, a second cutaway mechanism and ballast dumping. Therefore a ballast dumping mechanism is our only relatively new required stuff. When I work through the numbers I find 16oz of dumpable ballast is reasonable for a 6-pound payload (including the ballast dumping mechanism).

We can't afford to do what the big guys do while being funded by government budgets (read, "taxes"). We can afford to fly floaters by using our successful experience with latex balloons.

As long as we can do a launch that I have vacation time for, I'd be happy to help with the chase and recovery. I like the latex balloon method not only because of the cost, but also for the fact that we just have to cut the balloon way, It will burst on its own when it doesn't have a payload. So it's one less thing to go wrong.

1070. More on long-duration latex flight

Yahoo group: GPSL (2002 — 2008)
Date: 2004-12-13 23:51:45 UTC
From: n9xtn@cox.net
Topic: 1070 Message: 1070

I would suggest a goal of a 10-12 hr flight (dawn-dusk) for our first attempt. This would lend itself to a long day but could be handled with the 'normal' chase procedures. The chase crew could hang out at the launch site until something happened (commanded or unexpected). Might be a good Field Day thing - the chasers could play FD while monitoring the balloon. Recovery before dark would be nice.

We could probably learn a lot by having an SSTV camera pointed upwards to see what happened after the cutdown commands were issued.

Depending on how things go, I may try to design a dual cutdown for NSTAR in the next month or two. This would ease the transition to a main/booster combo as the rest of the logistics are worked out. The 'dual' part of the cutdown could be tested without the need for two balloons - just put a unloaded string through the other nichrome and make sure it gets cut too.

Anyone got recommendations on DTMF decoders? Or valves for releasing alcohol ballast? I don't think I'd do a ballast system on the first flight, but have a main balloon that would have some minimal positive free lift and a booster that would add a margin of 3-4 lbs more free lift. Having positive lift after the booster was cut loose would give you an eventual natural burst should the cutdown not work.

With a ballast system, I think the main would have some negative lift by itself and we'd vent ballast to achieve a float condition, similar to what HABET did.

As Ralph alluded, our challenge here (mine, anyway) is to create a long-duration flight with latex balloons, not just a long-duration flight.

I haven't kept up with the thread, so this may have
been covered.

One point I haven't seen covered yet is; it is my
understanding the latex balloons are designed to burst
after exposure to ultriviolet (?) rays or some light
band. I'm not sure the balloon would last that long
during daylight.

I know ours haven't. I think Pete's from a few years
ago is the longest I've heard of, about 8 hours?

1072. Controlled float of a latex flight.....

Yahoo group: GPSL (2002 — 2008)
Date: 2004-12-14 02:17:08 UTC
From: K. Mark Caviezel
Topic: 1072 Message: 1072

> Subject: Controlled float of a latex flight

Ralph: I've always really liked the MAIN and BOOSTER concept, but I think a long flight as you describe may be very hard to obtain. One out-house data point: For some reason, a couple years ago, we filled a 600 g (?) balloon to about 5 lbs buoyancy. It carried a couple test-loads on a 50' tether, then was retired to inside the shop area, tied to a rack. The amount of lift, not measured, just felt with a hand pull, seemed significantly less every day and on day five the balloon became negatively buoyant. At altitude , the latex will be stretched a lot thinner, and with much more surface area, so I'd guess that the diffusion rate would be much more than the ~1 lb/day buoyancy loss rate noted above.

Flights above 60k feet are probably a good idea, but dont forget that a sub 12 lb, part 101 exempt balloon has no reporting requirements, and those 12+ lb balloons are entirely legal when you add a strobe and keep up on the required (2 hr interval or as required) position reporting chores.

The multi-balloon flights of the JP Aerospace group are like 5 mains and 5 boosters flying together, I imagine things get rather crowded when the balloons grow to a larger diameter when the JP sky station ascends.

Anyway, it occurs to me that all the technology required to milk a long duration flight out low cost latex balloon flight may easily outstrip the cost of a ballast dumping zero pressure balloon if 80k feet is the mission goal. I'd be happy to put together some low cost plastic balloons of a modest size for the experienced amateur community, particularly if they want to fly them with ballast dumping. I've got some very nice 10k cubic foot balloons on the shelf that could find a new home for $200 each, and -probably after the first of the year- I could put together some 'fun bags' in the 2000 to 5000 cubic foot range and make them available to experienced amateurs for less.

1073. low cost simple latex concept

Yahoo group: GPSL (2002 — 2008)
Date: 2004-12-14 09:06:39 UTC
From: K. Mark Caviezel
Topic: 1073 Message: 1073

Ralph:
Respectfully, I think you're off a bit on your "10X" cost increase estimate for the jump from latex to poly. I've been quoted $200 to $300 for a 3000 gram balloon, definately in the same price range as a smaller poly balloon. The FAA does not require insurance, but Raven does, so to avoid the cost of that, it looks like not dealing with Raven may be the order of the day. Both my own group "ES-OS" and the Gross Pointe academy efforts have demonstrated real amatuer poly flights, with roll your own poly balloons. I can assure you that the "ES-OS" efforts don't total 10X of a bare-bones latex flight, except possibly the last flight with it's 152 lb test payload. But that's another story....

Anyway, if you really really don't want to use poly balloons, here is something that may be of interest: 6 lb payload, for example, with two 1200 gram balloons of 5.5 to 5.9 lbs buoyancy each. Fly em up on a tandem bridal. One will break, (hopefully retaining all the shards) and a slow descent will ensue. A ballast dropping system can be modulated to zero out the descent rate. Voila, neutral buoyancy long duration flight. This scheme negates the need for the cut away system, maintains FAA pt 101 exempt status, and could yeild a long duration flight.

1074. Re: [GPSL] low cost simple latex concept

Yahoo group: GPSL (2002 — 2008)
Date: 2004-12-14 09:55:59 UTC
From: wb8elk@aol.com
Topic: 1073 Message: 1074

I've done several 2 and 3 balloon flights some years ago.....the 3 balloon flight was interesting in that 2 of the balloons burst but one remained and provided a slow (and almost linear) descent...the balloon was actually visible standing above the tree line when we approached the landing area. I had a TV camera pointing up at them and they never really bounced into each other even though they were attached to one point on the flight train. the balloon with the lightest lift tended to fly below the plane of the parachute as it ascended.

I've toyed with flying 2 or 3 balloons and dropping ballast out after one or two of them burst and that should work just fine. The longest flight times would be an evening launch that stretched into the following day....my only concern would be the effects of UV on the latex for an extended flight during daylight...not sure if latex would survive for more than one day.

I'm working on a simple valve that I will probably fly in January or February to try to vent enough helium in a latex balloon to cause it to stop ascending....I will probably have to carry some ballast in order to refine the equilibrium point....especially if it keeps flying after sunset.

One fellow at a radiosonde site who has flown thousands of balloons told me this simple trick to achieve an extended flight.....put a wood plug in the neck of the balloon with small grooves carved in the wood....this allows a slow leak during flight....he says this works well and has achieved very long flights this way with a latex balloon.....you could achieve the same thing with a small hole in the middle of the wooden stopper....the trick would be to see just how large of a hole works to achieve a reasonable max altitude before it starts descending again...I imagine a few flights with different sized holes would be interesting to see how this works.

I've also done quite a number of polyethylene (zero pressure) balloons....from both the old Winzen and Raven....the biggest problem with those type is to figure out a way to cut the balloon down so it doesn't become a derelict....some schemes I've seen in that regards is to have a vent on the top of the balloon (which can also be used to control altitude), putting a weight on the top so that when the payload is dropped the balloon inverts and dumps helium (I saw them once use a rolled up newspaper for the weight).....or have a nichrome wire embedded in the plastic to actually burn a hole in the balloon (although I've observed static electricity actually cause this cutdown mechanism to fail before liftoff). These commercial balloons have become quite expensive now....one of our Rockoon flight's balloons cost many thousands of dollars...but fortunately we had a large membership and some large donations....but it was one of our major expenses....not to mention the hefty insurance cost.

They basically build these balloons by use of a person using a rolling heat sealer and walking along the balloon gore seam from one end to the other of a very very long warehouse....but these were for the balloons with heavy

payloads....for our lightweight stuff, the balloon doesn't need fancy and expensive load tapes in the seams and can be constructed in a garage or barn. Small tears or holes can be patched by a special low temperature tape (I have a roll from Raven for just such a purpose)....but have found out the hard way that regular tape will not work when it gets really cold.

Can you define "tandem bridle" a bit more? Will the balloons be in contact with each other at full expansion?

If they are in close proximity, and one bursts at its ultimate limit while the other is close to it (this is likely with equal inflation and equal size), wouldn't one balloon popping cause the other to pop, either through the latex snapping or just the shock of taking up more load?

For cost comparisons on poly v. latex for this concept, we should stick with 300-1500 gram latex balloons, which are $25-75. I don't think anyone is thinking of using a 3000g balloon for this concept.

One of the advantages of not flying a cutdown is that you get your balloon back to see how well it shredded. I would say a rough average for me is that I get about 60% back. It's been as low as ~5% (the neck and a few fragments) and the highest was 80% of a 1500g.

Perhaps the following will give us more understanding of floating flights.

Floater track prediction for ARRL Field Day based on Mean Zonal Winds
---
Ascent at 1000ft/min: 22mi east
Ascent at 500ft/min: 42mi east
Float at 80kft: 18mph west
Descent: 8mi east

Ascent at 1000ft/min and float lasting sunrise to sunset, 05:45 to 20:45 CDT (15hrs - which, with ascent and descent intervals, would break our #1 record of 15:19), would accumulate a track 22miE + 15x18miW + 8miE = 240miW.

Floater track prediction for minimal winds at 80kft during May and September
---
Ascent at 1000ft/min: 34mi east
Float at 80kft: 0mph
Descent : 12Mi east

Ascent at 1000ft/min and float lasting sunrise to sunset, 06:00 to 20:30 CDT (14.5hrs - which, with ascent and descent intervals, might break our #1 record of 15:19), would accumulate a track 34miE + 0 + 8miE = 42miE.

Hence the importance of flying floaters during May and September (unless the objective is a very long track and chase).

Analysis based on density and temperature values from U.S. Standard Atmosphere allows size of the MAIN and BOOSTER to be selected so they are not close to burst at desired FLOAT altitude. An example could be a 6-pound payload plus 1-pound of parachute, et al., using a 1500g MAIN and 1000g BOOSTER to yield the following:

1500g MAIN fill for equilibrium: 188ft^3 He
Expansion at 80kft: 70%
Burst: 103kft

1000g BOOSTER fill for 1000ft/min: 151ft^3 He
Expansion at 80kft: 78%
Burst: 96kft (after release)

At 80kft, neither balloon will be stressed close to bursting. There is reasonable history that indicates these two balloons could be tied off at the same height thereby allowing them to bounce against only each other as they expand.

If a ballast dumping mechanism, including ballast, is part of the 6-pounds (my given payload weight), then 1-pound of dumpable ballast would allow a

total of 840ft/min adjustment in ascent rate. A reduction to 7oz of dumpable ballast would allow a total of 540ft/min adjustment in ascent rate.

I select 7oz because I have designed a simple ballast dumping mechanism using a bladder-type baby bottle and a small pump (see http://users.crosspaths.net/~wallio/Ballast.JPG). The bladder allows a completely closed mechanism that will not leak fluid in any orientation. This mechanism weighs 1-pound with fluid.

Folks that are inclined to design and fabricate a controllable lifting gas valve may be interested in (or at lease amused by) my attempt to develop a valve that fits into the neck of a 2000g or 3000g balloon (see http://users.crosspaths.net/~wallio/Valve1.jpg) This design works on my bench. I can repeatedly open it 0-100% and close it with no mechanical problems. On the bench at room temperature the valve holds anticipated balloon pressure differential indefinitely (or over night which ever comes first).

When chilled to lower than -40dC (the limit of my accurate temperature measurement which was pinned) the valve worked repeatedly save for one minor flaw. After opening and closing, the valve seat leaks. I have not found a material that stops this leak in the temperature extremes of float altitude. This failure ultimately pushed me toward the MAIN and BOOSTER concept.

A flight during Field Day would be interesting. It's during vacation, so it's convienent. The chase of 240 miles is not excessive for a summer vacation drive. I would like to see us do something for Field Day and heavily advertise it. I'd recommend making a QSL card for the flight for those who contact us through the balloon. If we can add more weight, an opened repeater and SSTV would be neat also. Since hams are already out where the public can see them, we have help getting the word out about the flight to the public. The longer drift would help open the event to more people.

I don't remember if it was after I got back from GPSL 2004 or our next flight
that I ran a prediction with a 12 hr float @ 80,000. The payload would've ended up near Pueblo, Colorado from Tulsa.

If the long duration flight takes to the air, I have a light weight (2 pound) HF beacon package. It can send a PSK-31 message, 300 bps FSK APRS message, or 1200 bps A-FSK APRS message on a time schedule on any frequency 1 - 60 MHz. Tested down to -40 degC and flown on multiple flights. It would be good for over the horizon tracking.

I think we could choose a float altitude other than 80 kft that would be as close to zero as possible. Any particular day could yield 20 mph winds at 80 kft, whether May, September, or June. While the zonal mean is near zero, I would expect the standard deviation is 10 mph or better, and there could be north/south components that won't show in the zonal means.

Ideally, we'd choose a date based on actual observations and short-range forecasts, but this makes the logistics of arranging chase teams more difficult. So instead we'll choose a date well in advance and either fly a floater if things are suitable or a standard flight if not.

I'd rather have some net wind anyway. With our luck, we'd hover over a location for hours on end that would produce a landing smack in the middle of Omaha if we terminated the flight.

It also results in a lot of ground photos of the same thing.

From: wb8elk@aol.com
Topic: 1082 Message: 1082

One of the original Von Braun team of German rocket scientists here locally showed a film of an intriguing concept that they experimented with during the 30s....it was called RocketMail....they'd shoot rockets with mail to the next town, they even issued special stamps....I'd like to try this between our balloon groups with a "Balloon Mail" floater....a message in a bottle that "floats" in the stratosphere.

Around turnaround....a few weeks in May and also September, the lightest winds tend to be around 65k feet and so you could stay pretty much in your local area with a long duration flight during these times...this is also when the big boys in Palestine, TX and in New Mexico like to fly their large payloads to minimize ground travel. However during the rest of the year, the Balloon Mail concept would be very interesting to try.

In winter, a floater from the West would make a nice trip across country to several downrange balloon groups, in fact you could have several small packages (similar to Paul Verhage's parachuting Mr. Potato Head) and drop them off by a cutdown command over several waiting groups to the East....in the Summer, if you're up over 80k feet you could send them west to awaiting groups...particularly July and August.

Pete Sias's floater that went from Kansas to Ohio a few years ago actually landed within 15 miles of my parent's farm in Ohio...that's pretty close for BalloonMail.

I do Balloon Mail on a smaller scale by dropping payloads on the Atlanta Balloonatics (about 100 to 150 miles to my east) since that seems to be the general trend from October to April here.

Next July or August, I'm going to try to send a payload to ORB in Oklahoma...about 530 miles due west of here.

As to multiple balloon all bursting when one goes....my system with 3 balloons had a second balloon burst as a result of the first one bursting....but the one that was lightly filled and not near burst diameter survived...so the key here is to valve off helium before they reach max altitude or have a balloon burst when the other one(s) still are not very inflated. I was surprised to find that the balloons didn't bounce into each other very often during the flight even though they were next to each other at liftoff.

Hi MArk,

Airflow appears to keep the tandem balloons slightly separated in ascent -- but all bets are off regarding mutual burst.

Re keeping the shards: parachutes don't generate much drag when they're flying sideways. This is one of the more important causes of the the Dreaded Post Burst Chaos. In the worst case, one of the payloads will have more drag than the sideways 'chute and will end up flying ABOVE the 'chute (we have fotos of the 'chute BELOW the horizon!).

The best time to get shut of the shards is IMMEDIATELY at burst, if not sooner. If you wait even 10 sec, the shards can get into the 'chute shroud lines.

PS: I have lotsa latex shards that I'll be glad to send you.

Hi MArk,

EOSS did an 8-hr ZP flight with Norm Kjome for the USAFA 'way back. Float hit right at 100K', and the balloon took on a 200-mi long, oval course at altitude during the day, and returned to nearly the same spot in the sky where it entered float, 8 hrs later. Then we cut it down. So yeah, it's tough to predict a long-duration trajectory, and foolish to assume constant winds aloft for the duration.

> Can you define "tandem bridle" a bit more?
Will the balloons be in contact with each other at
full expansion?

For Mark Connor:
oooops, I chose the wrong words for what I was trying
to describe. Maybe 'dually bridle' would have been
better. Think about: Take balloon A, tie a 50'
piece of string to it. Take balloon B, tie a 50'
piece of string to it. Then tie the strings together
at thier ends. Then tie the payload to the joint
between the strings. If the strings are long enough,
I don't think the balloons will be touching at full
expansion. The concept of Blammo A setting up
Blammo B is a possibility. I dunno, just seems like
a real simple way to possibly milk a 2-3 hour flight
into 6-12 or so.

The possibility of the two 50 ft lift lines getting twisted
together inseperably is an even greater certainty.

1091. WB8ELK-11 balloon headed out to sea as well

Yahoo group: GPSL (2002 — 2008)
Date: 2004-12-19 19:16:08 UTC
From: wb8elk@aol.com
Topic: 1091 Message: 1091

Hi Ralph,

Wishful thinking on my part. Instead of the GPS battery coming loose at burst (which is what I was hoping had happened), your analysis of the digipeater paths from the last few APRS transmissions certainly prove that it was still floating at altitude at the last APRS transmission on 2340:11z. It was just concidence that the PocketTracker battery lasted 35 minutes longer than the GPS battery.

I received a description this morning from Wes KD4RDB in Sumter, SC of what the voice ID on 144.31 was doing near the end (i.e. getting very slow and garbled - which is what the voice ID does just before it freezes up) indicating that it just simply died out from the cold and was on it's merry way to the Atlantic. The last known reception report of the voice ID was at 2324z from K4QI.

Solar heating sure has a big effect on internal payload temperature as well as balloon lift...it will be interesting to plot altitude, internal temperature and battery voltage vs. time (with sunset at the balloon's altitude indicated). N4TXI-11 downlinked battery voltage and internal temp: A=103215 B 021 320 .. the B is satellites in view in HEX, 021 is internal temp (value - 60 = temp in C, -39 in this case), 320 is battery voltage*100 ... i.e. 3.20 volts.

The balloons may have floated until an hour or two after sunrise...so it's possible they travelled an additional 1000 miles or more to the east before bursting.

So it would appear that to get a long duration flight, fly close enough to sunset so that you lose solar heating lift before you reach burst altitude (at least this appears to work for 320 ft/min ascent rate)....it would be a good experiment to try this again but from a group with more breathing room before hitting the Atlantic.

Maybe the payloads will be found by a boat eventually....looks like we have two ocean-going buoys now.

- Bill WB8ELK

1092. WB8ELK-11 reappeared this morning flying near Nova Scotia

Yahoo group: GPSL (2002 — 2008)
Date: 2004-12-19 21:17:32 UTC
From: wb8elk@aol.com
Topic: 1092 Message: 1092

As I was copying off the Findu raw data from my flight this afternoon (Sunday), I noticed some new entries timestamped on the Findu raw data starting 1259:21z until 1557:55z this Sunday morning. It looks like the PocketTracker battery warmed up after sunrise and started to work again but the GPS battery apparently is dead so no valid position is being reported so it's not showing up on the main FindU tracking page but was recorded on the Raw Data.

The digipeaters that were being hit by it are from Maine, Nova Scotia and New Brunswick, Canada, so it would appear that it was flying in that general vicinity until about 1557z when the balloon probably burst or landed (or splashed down).

Here's the last reports from FindU on Sunday morning starting from the point where it first starting working again at 1259:21z:

1094. WB8ELK and N4TXI long duration flight details

Yahoo group: GPSL (2002 — 2008)
Date: 2004-12-20 10:43:49 UTC
From: wb8elk@aol.com
Topic: 1094 Message: 1094

Hi Zack and the group,

Payload Details:

HiBall-2 (WB8ELK-11):

- APRS Payload weight: 10 oz
(Pocketracker with Garmin GPS-18LVC each powered by a lithium 9V)
- 144.31 voice ID weight: 5 oz
(Pelican Systems Foxhunt voice ID 50 mW transmitter powered by one lithium 9V)

Balloon: Scientific Sales 1500 gram

Total Flight train weight (includes payloads listed above): 1lb 4oz
Nozzle Lift: 2.0 pounds

Initial ascent rate: 270 ft/min

details and photos will be on my website by late this week:
http://www.wb8elk.com.

N4TXI-11 balloon details:

- APRS payload: 1.0 lb
(N4TXI's own single chip design called the WhereAVR based on the AVR ATmega8)
Transmitter: Alinco DJ-S11T with Garmin GPS 18-LVC - powered by 3 lithium
AA's in the Alinco radio

Details on his website: http://www.garydion.com

Balloon: Scientific Sales 1500 gram

Total flight train weight below balloon (includes payloads listed above): 1lb
4.5oz
Nozzle lift: 2lb 4oz

Initial ascent rate: 320 ft/min

Flight synopsis:

Here's some details about the 22+ hour HiBall-2 flight....it was intended
to be a high altitude record flight, but since I only hit 270 ft/min ascent
rate, it took hours to reach 98,570 feet....at that point sunset occurred at the
balloon and it stopped it's ascent and levelled off for awhile and then slowly
descended....very very slowly. This is well below the burst point of a 1500
gram balloon filled with 2 pounds of nozzle lift so it flew on it's merry way
out to sea and apparently followed the eastern seaboard. At 2306z (after almost

6 hours in the air) the GPS battery froze and failed...at 2340z the Pocketracker battery also froze...this was just southwest of Charlotte, NC. Shortly after sunrise on Sunday morning, I was surprised to see on Findu's raw data file that the PocketTracker had apparently thawed out and was being relayed through three stations in New England....N1QPR-2 (MASS), N1YHR-15(MASS) and then the final transmissions were relayed by VE1MTT in Nova Scotia. This was after 22hours and 44minutes of flight time and a flight distance of 1201 miles. If I got lucky it may have landed in Nova Scotia, but more than likely ended up in the Atlantic.

N4TXI had more lift than my balloon and went up a bit faster....at sunset it stopped ascending at 105,224 feet and slowly descended for awhile and levelled off. After over 8 hours of flight time and 626 miles downrange, it headed out to sea near Cape Hatteras, NC and was zipping along at 112 mph at 103k feet....at that point the batteries froze out as the internal temperature was -40C or below (his sensor bottoms out at -40C). If it came back on at sunrise, there were probably no digipeaters in range.

Topic: 1094 Message: 1096

Hi Bill,

Most sincere condolances for your losses, Bill. I hope that they do
come home, like a bad penny, eventually ...

For what it's worth, it seems that a little waste heat in a payload
isn't necessarily a bad thing. This is what concerns me about the
PocketTracker - that, plus the fact that the VCO in the PLL isn't
well temp-compensated. It is possible that battery didn't die, but
that the VCO warmed up enough in the morning sun to lock back up on
144.39. On two flights where we test-flew a PocketTracker, it
failed up near the tropopause, but worked fine on the deck.

Your observation about the slow ascent rate causing loss of lift
after sunset is well taken. However, slow ascents have resulted in
latex stalls even in full sunlight. So I get a bit spooked by ascent
rates under 800 fpm. This notion appears to be supported by the
fact that your faster balloon hit a higher altitude than did
the slower one.

Per LifWin 0.4, your fills should have yielded ascent rates in the
400 - 600 fpm range, with bursts that would have garnered the Onset
prize. But LiftWin may lose some precision at such low fills.

1097. Re: [GPSL] WB8ELK and N4TXI long duration flight details

Yahoo group: GPSL (2002 — 2008)
Date: 2004-12-22 07:57:53 UTC
From: wb8elk@aol.com
Topic: 1094 Message: 1097

Hi Mike,

Both of our balloons were well below expected burst altitude, so since they both stopped ascending almost at the exact same time (both within minutes of the time when the Sun stopped shining on the balloons), I would imagine the levelling off effect occured due to the loss of solar heating. I had one float on me in the middle of the day on Dec 4th but that one made it up to 117,181 feet...same payload and a bit more nozzle lift....but it had a slow ascent rate (550 ft/min) which allowed it to go into equilibrium for 2 hours before it eventually burst.

I think we only had a few ounces of lift on 12/18....since it was difficult to precisely measure the lift with the small wind gusts we encountered outside while filling the balloons. Floatwin showed we should've gone way higher and ascended faster too...so it would appear we had a very small positive free lift. It was a bright sunny day and we inflated outside.

Gary's balloon (N4TXI) levelled off perfectly at 103k after sunset....mine seemed to be slowly descending....mine had less lift in it...also the fact that it ended up near Nova Scotia indicates it probably came down to 45k to 60k feet during the night since that's the only way I can imagine it hitting winds that would send it in that direction. Ralph Wallio sent me a chart that showed jet stream winds heading in that precise direction at the time. Gary's balloon probably headed out towards the Bermuda Triangle.

I adjusted the tuning voltage on the PocketTracker to 2.6 volts to compensate for the cold...offset from the 1.8V they recommend for normal operations. I tested this in my freezer before I flew. It is entirely possible that the VCO just drifted out of lock due to the extreme cold after sunset. I flew it 5 times prior to this flight and it never dropped out of lock when the tuning voltage was set to 2.6 volts during a daytime flight....but I must admit that it's pretty tricky and touchy to adjust precisely.

Hi guys,

I tuned my VCO low to compensate for the cold and have tested mine for hours with dry ice on it and it works just fine. It also has remained stable on all three flights where it has flown. I agree that if you don't retune the VCO for the cold like the designer recommends that you could have the problem you describe but the VCO's ability to lock is so wide that with it tuned correctly you should not have any problem.

Comment from NG0X: Mike, in all fairness, it's only appropriate to also mention the FLAWLESS operation of the Pocket Track + Garmin Etrex I flew as the AC0AK-11 beacon on EOSS 79.

http://www.eoss.org/eoss079/EOSS79_ac0ak_landing.mpg

Check the video - The Pocket Tracker was the only tracking beacon I used during the entire flight and it worked well during the entire flight and infact had beacons decoded from over 400 miles range during the flight. (oops, I think Rick N0KKZ may have taken that video down to save space on the website). Two Pocket Trackers were also used successfully on the record setting "ES-OS SEVEN" mission which parked a heavily laden floater at 40k feet. - it doesn't get any colder than that !
All that having been said, Ive been thinking about doing some thermal analysis to see if a thermostatted electrical heater in a highly insulated payload container has any chance of working.

- KMC ng0x, former ac0ak

As my ol' boss usta say, "One 'aw, (shux)' is worth ten attaboys".

Thus far, the in-flight failures remain undiagnosed, but one needs better than a 333 batting average with an APRS beacon to ensure commercial flight separation and payload recovery. The fact that the VCO requires a special tweak for frigid ambients does arouse suspicion, however.

Perhaps the proximity of the Altoids tin lid to the unshielded VCO tank changes, even snaps, in the combo of low ambient temp AND pressure? We one had a new product with a laminated dome switch control panel that checked out 100% during production test in Denver, but which declared a high rate of "stuck button" power-up faults in San Francisco. We were able to duplicate the problem by putting the panel in a pressure chamber and punching it up 3 psig - approx the same delta baro pressure between here and SFO. Turns out that one touch switch on the panel was not properly vented.

I still propose that those who have properly set their Pocket Trackers up for near space (extreme cold) operation, as directed by the designer, have had zero problems with cold related failures. Some of those who chose not to adjust the VCO have had problems. I see the capability to adjust the VCO, not as suspect, but as a positive design feature that allows the unit to be set up as required to perform in a wide range of temperature enviroments from extreme heat to extreme cold. It's not that the VCO "requires a special tweak" rather the VCO is factory adjusted to perform flawlessly in temperature ranges that would normally be encountered on the surface of the earth, from extreme heat of being inside a closed car in the summer to being outside in normal cold that would be encountered in a search and rescue mission in the mountains in winter.

Also, to my knowledge there are no components in the PT design that should be effected by pressure changes and I can't imagine that anyone has built their unit so that the can is airtight. I can state that -109.3 degrees f for 3+ hours had no negegative effect on either the can or the operation of the PT during the two tests that I have run on it. I intend to run another test for 12+ hours soon.

I suppose it's all in your approach to life (you know, glass half full or glass half empty kind of thought patterns) and continued PT flights will continue to either disprove or prove the design. I like and trust the design and have seen many others obtain flawless performance from the Pocket Tracker when used as directed.

1103. pocket track cold issues II...possible GPSL payload session ?

Yahoo group: GPSL (2002 — 2008)
Date: 2004-12-24 18:02:12 UTC
From: K. Mark Caviezel
Topic: 1103 Message: 1103

Rick: thanks for leaving the EOSS 79 landing video up. Something was boned-up on my computer or internet connection yesterday, I thought it was down. It's working now.

Mike: There's no argueing with the success of the Pocket Tracker I flew on EOSS 79 - it simply cannot be explained away as an accidental success - and at the same time the flight failures you've seen are of high concern. If you do diagnose exactly what went wrong it would be a service to the "ARHAB" community to report it. Here I guess would be a good place for it.

Stephanie: wow, that sounds like a brutal cold soak! Shivver my timbers ! Thanks for passing along the results.

GPSL tie-in - How about a session for detailed payload show-and-tell at GPSL? Bring your well performing payloads, and your skyturds, and let's learn from each others successes and mistakes. I know many people focus on the 'egg-head' portion of the payloads - the active electronics, but a successful stratospheric payload needs to acheive excellence in packaging, attachment, antenna, wiring, and power source as well.

- KMC ng0x (gonna spend some time thinking about cold + low temperature, invite others to do the same).

1104. Congrats to TVNSP on the record altitude for 2004

1106. TVNSP Onset Prize entry - a winner from my viewpoint

Yahoo group: GPSL (2002 — 2008)
Date: 2005-01-02 14:18:09 UTC
From: Ralph Wallio, W0RPK
Topic: 1106 Message: 1106

Paul,

My thanks for creating our 2004 ONSET PRIZE. You have again added more excitement to Amateur Radio High Altitude Ballooning!

From my viewpoint TVNSP has won the 2004 Onset Prize with TV04G rising to 118,946ft on 27Dec04.

Regarding our Onset Prize requirements:

1. Announce your flight at least a week prior to launch (announce the general launch location, callsign of the near spacecraft, and its frequency)

TVNSP announcement was received and posted on 18Dec04.

2. Use a GPS receiver and APRS to transmit position data during the mission
3. Transmit APRS data such that other amateur radio operators can record the data

GPS APRS data is available as downloaded from FINDU.COM. TVNSP submitted additional GPS derived data captured by their IHU.

4. Obey FAR 101 requirements

Contact TVNSP if there are any questions.

5. Recover the near spacecraft

TV04G payload was recovered as discussed in TVNSP web page below.

6. Announce the results of the flight (include several packets or posits around the peak altitude)

See TVNSP flight archive,
http://www.tvnsp.org/modules.php?name=Flight_Archive.

The OnSet Prize has been awarded to TVNSP. I'll make arrangements to get the prize, a four channel data logger, temperature sensor, and software to them.

I'm in the process of creating more prizes for 2005. So far I have one offer of sponsorship this year. After I get them all lined up, I'll announce them. If you're interested in sponsoriong a prize, or know someone who is, please let me know.

Paul

1108. AAA lithiums

There are AA lithiums too. Good 1.5V replacements for alkalines.
I will probably go to these for payload batteries when my Li-ion
batteries quit working by discharging them too hard.

Battery capacity is about 3000-3500 mAh.

Be careful on the 3000mAh spec. My experience is that the capacity is largely dependent on the load that it's powering. As I recall, if you read the fine print on the spec sheet, the capacity is assuming something like a constant 1mA load.

Nevertheless, they're good batteries. We've flown them on most of our flights with excellent results.

http://data.energizer.com/PDFs/lithiuml91l92_appman.pdf

I misread the graphs, thinking they were mA instead of mW. So
the capacity is more like 2400 mAh with a constant 1000 mW load
(about 666 mA at 1.5V).

1113. GPSL 2005 official date change - July 1-3, 2005

Yahoo group: GPSL (2002 — 2008)
Date: 2005-01-04 17:41:53 UTC
From: n9xtn@cox.net
Topic: 1113 Message: 1113

After talking with Paul Verhage KD4STH and some others by e-mail, the best of a sub-optimum set of choices is to have GPSL 2005 on July 1-3, 2005, here in Omaha. I apologize for having to move the date and possibly preventing some groups from attending in person.

We will continue with having the symposium on Friday, the primary flight day on Saturday and the backup flight day on Sunday.

I know EOSS is planning a flight on 2 July from Colorado. I'm hopeful they can participate in GPSL vicariously and perhaps we can have a longer-range EBBE contact. If there are other groups who can't attend GPSL in person, I hope they can also fly at the same time and if they are in range possibly have EBBE contacts with them as well.

I will update the website (www.superlaunch.org) in the next day or two to reflect the new date. I'll submit articles to the local ham radio club newsletters and hopefully boost local participation.

We should also plan to send notices to national magazines like QST, CQ, CQ-VHF, and ATVQ. I can draft something and submit it to the group for review prior to sending it off.

Again, thanks to all for your flexibility and sorry that it was necessary to change the date.

73 de Mark N9XTN

1114. Fw: AIAA Balloon Technology Conference

Yahoo group: GPSL (2002 — 2008)
Date: 2005-01-05 20:37:56 UTC
From: Mark Conner
Topic: 1114 Message: 1114

Too bad the conference isn't closer.....

- Mark

AIAA Balloon Technology Conference

You are receiving this email message because you may have an interest in Scientific Ballooning. If you wish to be removed from this email list please reply to this email (Henry.M.Cathey.1@...) with a request to have your email address removed.

Dear Colleagues,

AIAA Ballooning Technical Committee will be having a conference from September 26 to 28, 2005 in Crystal City, Arlington, Virginia (near Washington, D.C.). The Ballooning sessions will be part of the AIAA/ATIO conference. We will be co-located with a number of groups including the AIAA Lighter Than Air (LTA) group. It is hoped that we will have a real synergism with the LTA group and we are planning for several combined sessions on topics of mutual interest.

The call for papers was included in the September 2004 issue of Aerospace Magazine (pages B12 and B13). The abstract deadline is February 7, 2005. The information for this conference can be found at the AIAA web site (https://www.aiaa.org). From the main page follow the link in the upper left hand corner to "Conferences & Events". Scroll down to "September" and the "AIAA 5th Aviation, Technology, Integration, and Operations Conference (ATIO), 16th Lighter-than-Air and Balloon Systems Conference". You can then follow the links for the call for papers, and to submit abstracts. (Please be sure to follow the links for the Balloon Systems section.)

This meeting is a chance to share the advances being made in balloons and to learn what else is going on in our unique ballooning community. We want to encourage you to attend this meeting. Right now, we also want to encourage you to submit an abstract to present a paper. We have the prospects for an exciting conference with LTA and Balloons combined in one series of sessions and involvement with the aviation industry at large.

We are looking for members of our community to present at this conference. There are many fascinating and exciting projects and research efforts for which the stories need to be told. This is a chance to share with your colleagues. Of special interest are some of the small ballooning efforts. Currently there are a number of ballooning efforts focused toward Homeland Security and DoD applications. This conference is an open, international conference without any closed or restricted security sessions. Potential presenters should verify the need for and obtain the appropriate approval(s) for presentations in this type

of forum. Again the abstracts for the conference are due February 7, 2005. Abstract submission instructions are on the AIAA web site mentioned above.

I you have any questions about the conference, please contact Koh Murai (Koh@...) or Henry Cathey (Henry.M.Cathey.1@...).

We look forward to your enthusiastic participation!

Sincerely,
Henry Cathey, AIAA Balloon Technical Committee Chair
Koh Murai, AIAA Balloon Technical Committee Conference Coordinator

1115. Re: [GPSL] GPSL 2005 official date change - July 1-3, 2005

Hi Mark,

Yeah, I'm also disappointed about GPSL '05. There is some small hope that the CU Upward Bound flight can be moved to let us get to Omaha, but summers are jam-packed with not only student flights but also special events that many EOSS members support.

I expect that we will be flying the KPC3-based APRS module on one of the two 3000 gm Upward Bound flights on 2 July. I'll make a point of installing the 5W radio and J-pole; I plan to have that one on 144.34.

I do recommend that anyone wishing to try an EBBE do it ARQ - it's just not possible to watch both balloons to catch a single BBE beacon. I saw Ralph's UI to to me on GPSL '04 only while reviewing the packet log file after the flight was recovered. But if there had been an ARQ connect, the connect bell on the 2nd laptop in Rick's car would have sounded and I'd most likely have heard it.

To do an ARQ, connect thru the GPSL balloon to the EOSS balloon KNode, BALNOD. After that's acked and you get the prompt, then C AE0SS, which is the new callsign of the EOSS packet ground station.

Hi Chris,

Sounds like you've had your first taste of "false lift", since it seems your surface winds during fill were pretty brisk (faster than you could run).

False lift is just like regular airfoil lift, except the airfoil is the top of your balloon, which is anchored to the ground. Trouble is that when you release the balloon, it travels at zero horizontal airspeed, and the false lift thus disappears. Experienced balloonists can anticipate and correct for false lift, but even they strongly prefer dead calm. EOSS won't even fill the balloon if the wind is over 10 kt -- well, HARDLY ever.

If you can't avoid a windy day, then you can minimize false lift by filling close the leeward side of a 2+ story building. If it's gusty, judge your fill by whether the tare weight drops when the wind is the calmest.

Even so, an overfill will always be the safest side to err on. The worst that an overfill will do is cause a lower than normal burst, since there's more gas in the bag. And since you were worried about going too high, that would have helped. An underfill, e.g., predicted ascent rate under 700 fpm, also risks an ascent rate stall, which can make for a REAL long downrange trip!

Better to use the smallest balloon that will lift your payload, however. According to Hank Riley's Liftwin 0.411, a 100 gm Totex with a 2 lb flight string and a nozzle lift of 6.5 lbs would get you over 1300 fpm ascent rate and a burst at about 10,000 ft. (Although we've seen balloons with predicted bursts of 15K' go above 40k'!) The entire flight would last under 15 minutes, so you wouldn't have to travel far to therecovery site.

And that would require just half a K bottle of He.

Anyway, congratulations on your first flight AND a 100% recovery rate!

World Year of Physics 2005 Newsletter - January 2005

"Help Make 2005 Another Miraculous Year"

****
In this issue:

1. Sign-up Deadlines: January 31, 2005

2. International Launch Event in Paris: Physics for Tomorrow

3. Physics Enlightens the World

4. Physics Across the World International Poster Competition

5. Get Inside a Physicist's Head!

6. WYP T-Shirts

7. 2005 Event Finder now online!

****

Happy World Year of Physics 2005! What we've all been waiting for is finally here.

You're receiving this message because you signed up to be on the list at our website or at an APS, AAPT or other scientific meeting. This newsletter, containing information about the upcoming World Year of Physics 2005, is distributed approximately every six weeks.

1. Sign-up Deadlines: January 31, 2005

If you're a middle school or high school teacher, the deadline to sign-up for our classroom projects is January 31, 2005.

PhysicsQuest is our investigative hunt for middle school students. http://www.physics2005.org/events/physicsquest/index.html

High school students can team up with other students to Measure the Radius of the Earth. http://www.physics2005.org/events/eratosthenes/index.html

Teachers guides will be online soon. If you've already signed up, you'll be receiving information very soon.

2. International Launch Event in Paris: Physics for Tomorrow

"Physics for Tomorrow" will take place January 13-15 in Paris, and will be open to the general public. It will aim to capture the attention of the international press and media, so that events and celebrations organized around the world throughout the year will attract public and media attention. For more information, click on: http://www.physics2005.org/international.html . You can also get live updates on the conference from APS News reporter Ernie Tretkoff at http://www.physics2005.org/wypblog .

3. Physics Enlightens the World

In the World Year of Physics 2005 as many people as possible should get the feeling to be part of a great physics community spanning the whole globe. "Physics enlightens the world" is an endeavour to achieve just that: A world-wide relay of light to commemorate the 50th anniversary of Albert Einstein's death on April 18, 2005. For more information, click on: http://www.physics2005.org/events/projects.html

4. Physics Across the World International Poster Competition

A poster competition for students aged 10 - 16 years to mark the World Year of Physics in 2005. Students can create their own colourful posters to show how physics applications makes their lives better and has a positive impact on their everyday lives. For more information, click on: http://www.physics2005.org/events/projects.html

5. Get Inside a Physicist's Head! Only on the Quantum Diaries Website.

Who travels the world in search of the unknown? A pirate? An international spy? No! A physicist! Quantum Diaries will follow the lives of scientists from around the world as they live the World Year of Physics 2005. In their own words, in photos, blogs, and videos, it will tell the real-life stories of real physicists in real time. Launching Thursday, January 13! Sign up for a launch announcement and e-mail updates today at: http://www.quantumdiaries.org

6. WYP T-Shirts

World Year of Physics T-Shirts are now available. Look as smart as you really are in a WYP T-shirt. Get your's today at: http://www.spsnational.org/societynews/2005WYP_shirts.htm

7. 2005 Event Finder now online!

The WYP2005 Online Event Finder is now available. We want to hear about YOUR World Year of Physics event in the United States. Add your open house, public lecture, lab tour, or physics demonstrations to our online event finder so others in your area (and around the country) can find out about your events.

Click here to submit your events:
http://www.physics2005.org/events/submit.html

****

For more information on the World Year of Physics 2005, email vinaya@...
or visit our website at http://www.physics2005.org.

1120. EOSS/Colo SGC launch sked - GPSL '05 possible

Yahoo group: GPSL (2002 — 2008)
Date: 2005-01-29 00:43:37 UTC
From: Mike Manes
Topic: 1120 Message: 1120

Hi Folks,

Chris Koelhler and I chatted today about some of the upcoming
EOSS flights, summarized:

1. The Upward Bound 2x heavy flight, now set for 2/3 July 05 and
conflicting with GPSL '05, could move to 16/17 July to join up
the StudentSat 4 Workshop 1 x heavy, where Mt State could so the
heavy lifting for the Workshop launch. This would be a 3x, however,
and would still require 45 minute launch interval, and Mt State
may not be willing to do a 3000 gm launch.

If these are overcome, how many of you in EOSS will be willing to
go to Omaha for GPSL and also work the 3-fer on 16/17 Jul?

2. Chris asked us to consider moving the DemoSat 3 flight up a week
from 6/7 Aug to 30/31 July, 2 weeks after the above 3-fer. This
will leave Aug '05 latex-free.

Does this conflict with anyone's plans?

3. The USAFRL SHOT 4 flight on the docket for TBD late summer won't
go until spring '06.

4. Pending FAA approval of U Ky Big Blue glider free-flight with
portable TRACON radar collision avoidance provided by NASA Ames, Big
Blue 4 is on the docket for 17/18 Sept.

Let me know at your earliest convenience if there are any concerns
with going ahead with these changes.

From: Marty Griffin
Topic: 1120 Message: 1121

Hi Mike,

Maybe this schedule shake-up will let N0PUF join us for a few flights! I'm OK with this plan, but questionable for the Big Blue flight September 17/18. However Larry N0NDM can nicely handle the flight and I'll ask him about it. OK for Omaha - finest place you ever saw!

Good luck with the coordination of these plans! Let us little people know when the plan settles down as we all have changes to make.

- Marty, WA0GEH

Below is a draft announcement suitable for sending to club newsletters, etc., regarding this year's GPSL. Please let me know of additions, corrections, or style changes you'd like to see. I'd like to send this to area clubs shortly. I'd also like to send a shorter version to QST, CQ, and CQ-VHF.

73 de Mark N9XTN

==========

The fifth annual Great Plains Super Launch (GPSL) is scheduled for July 1-2, 2005, in Omaha, Nebraska. This year□s event will be hosted by Nebraska Stratospheric Amateur Radio (NSTAR). The GPSL brings together amateur radio high-altitude ballooning groups from across the United States to this two-day event. On Friday, July 1st, a conference will be held where presenters will discuss the latest technology, techniques, and accomplishments in the community. Saturday morning will feature the launch of multiple balloons with their payloads, which are then tracked and recovered within a few hours. If the weather is unfavorable for flying on Saturday the 2nd, the backup flight date is Sunday the 3rd.

Amateur radio high-altitude ballooning features the use of lightweight balloon-borne payloads which are tracked by radio and subsequently recovered and reused on future flights. The simplest of these payloads contain a GPS for tracking the position of the payload, a radio modem for encoding the data, and a radio for transmitting the data to ground stations. More complex payloads may contain cameras, scientific instruments such as Geiger counters, or additional radios for communications experiments. These flights frequently reach near-space altitudes of 80,000 ft or more during their two-to-four-hour flights, and must endure temperatures of -75°F and pressures less than 1% of that at the earth□s surface. Flight distances are dependent on the wind, but can be anywhere from just a few miles to a few hundred miles. Most, however, are 20 to 100 miles. The groups also adhere to FAA regulations regarding unmanned free balloons during their operations.

Tracking is performed with the amateur radio community□s Automatic Position Reporting System (APRSTM). APRS uses the packet radio standard 1200-baud transmissions in the 2-meter amateur radio band with the location information encoded in the data packet. This allows the ground stations to track the balloon□s position to an accuracy of 60 feet or better. Other payloads typically use amateur radio frequencies in the 2-meter or 70-centimeter bands.

Anyone with an interest in high-altitude ballooning is invited to attend the conference, balloon launch, or both. The conference and launch sites are yet to be finalized, but will be within a 30-mile radius of central Omaha.

The latest information on the 2005 GPSL will be posted to the event□s web site at <http://www.superlaunch.org/> http://www.superlaunch.org. Questions can be directed to Mark Conner, N9XTN, at <mailto:n9xtn@...> n9xtn@cox.net.

Hi Marty,

Well, this is what Chris and Suzanne desire, and I'm just asking
the gang if there are any impediments to making it happen. So far,
so good!

And I'm up for a trip to Omaha this year as well. Hope we get
enough to do a launch and recovery.

Mark,

Thanks for hosting and managing all the details that will make GPSL 2005 an event to remember!

Perhaps the best way to relate my suggestions is to offer another version. You are welcome to use all/part/none of this as you see fit.

Regardless, the ARRL may decide to use your announcement in QST, W1AW bulletins and/or their web page. We could also send it to AMSAT for use in their weekly bulletins and/or the AMSAT Journal.

The fifth annual Great Plains Super Launch (GPSL) will be held July 1-3, 2005, in Omaha, Nebraska, hosted by Nebraska Stratospheric Amateur Radio (NSTAR). GPSL 2005 will bring together Amateur Radio high altitude ballooning groups to share information and participate in simultaneous flights.

Discussions on Friday will cover technology, techniques and accomplishments in the community. Super Launch on Saturday morning will involve several simultaneous flights which will be launched, tracked and recovered all within a few hours. We will try again on Sunday if weather is unfavorable for flying on Saturday.

Amateur Radio high altitude ballooning uses lightweight balloon-borne payloads which are tracked by radio, recovered and then reused on future flights. Payloads usually contain GPS receivers and report position using Amateur Radio APRS techniques (Automatic Position Reporting System). Payloads often include cameras, scientific instruments, and radio equipment for communications experiments.

Flights frequently exceed near-space altitude of 80,000ft, endure very cold temperature often lower than -70dF and atmospheric pressure less than 1% of that at the earth's surface. Flight distance and direction are predictable from a few to several hundred miles depending on winds aloft. Amateur Radio high altitude balloon flights in the USA adhere to FAA regulations for unmanned free balloons.

Participation in GPSL 2005 is open to everyone interested in Amateur Radio high altitude ballooning regardless of experience in either Amateur Radio or ballooning. Updated GPSL 2005 information will be posted at http://www.superlaunch.org/. Direct questions to Mark Conner, N9XTN, via n9xtn@....

A few specific thoughts --

Amateur Radio is usually capitalized (as is Ham)

Perhaps we shouldn't discourage international participation by saying "United States".

Conference - Seminar - Symposium -- which ever feels best

Our simplest payloads do not include GPS receivers. They include radio telemetry beacons recovered using direction finding (fox hunting) techniques.

"Radio modem" doesn't seem quite right but neither does TNC (because we often use Tiny Tracks, MIM-modules, etc., which only encode and MOdulate (not decode and DEModulate).

Ralph,

Thanks for re-drafting the announcement. I would like to wedge in something to the effect that most of our operations will be on 2m and 70cm, so people will know that the radio equipment they probably have on hand will receive our signals (as opposed to specialized radios, etc).

I'll have another version out shortly. I was trying to make something generic enough to use in non-ham publications, but may have to make separate ones (non-ham version less technical).

- Mark

Greetings.

A heads-up for everyone who might not have heard, the FAA's
Air Traffic Control is being outsourced. The FAA will announce the
winner of the A-76 contract at 3PM on tuesday, February 1, 2005.

I've been in touch with our FAA liason about this, and he said that
the Part 101 stuff is being specifically excluded from the contract
statement. What this means for rocket and balloon activities is that
handling of NOTAMS and waivers will not be handled through Flight
Service in Grand Forks after the transfer date (probably next fall).
FSDO (Flight Service Disctrict Office), or some other office
will handle it, he didn't know. Given the fact that he didn't know
if he'll have a job after the transfer, I didn't feel it was the right
time to press him for more details.

He said there will be a press conference at the GFK Station tomorrow
afternoon (tuesday, Feb 1), so keep your ears open for any more info.

Plug 'A-76' into google or any other search engine for more info
on this whole mess. I'll be sure to relay any more info as I come
across it. It's hard to guess what effect this will have on balloon
and rocket activities at this time.

The A-76 to be announced shortly is related to Flight Service Stations,
which is where most of us enter NOTAMs for balloon flights.

My guess is that other 24/7 FAA operations, such as TRACONs or ARTCCs, will
become responsible for Part 101-related NOTAMs. I don't believe FSDOs are
24/7.

1134. Revised GPSL flight announcement

Yahoo group: GPSL (2002 — 2008)
Date: 2005-01-31 21:08:51 UTC
From: Mark Conner
Topic: 1134 Message: 1134

I decided not to put in freq/band information as it was long enough as is, but did add a sentence about student experiments to indicate there is a public service aspect to this. The short version is more for something like QST's "Strays".

For a picture, I'll probably submit a higher-resolution version of this unless someone has another suggestion:
http://www.nstar.org/NSTAR/NSTAR04D-launch.jpg

73 de Mark N9XTN

Long version:

The fifth annual Great Plains Super Launch (GPSL) will be held July 1-3, 2005, in Omaha, Nebraska, hosted by Nebraska Stratospheric Amateur Radio (NSTAR). GPSL 2005 will bring together Amateur Radio High Altitude Ballooning groups to share information and participate in simultaneous flights.

Friday, July 1st, features a conference which will cover technology, techniques and accomplishments in the community. The Super Launch on Saturday morning will involve several simultaneous flights which will be launched, tracked and recovered all within a few hours. Sunday is the alternate flight date if Saturday is unfavorable.

Amateur Radio High Altitude Ballooning uses lightweight balloon-borne payloads which are tracked by radio, recovered and then reused on future flights. Payloads usually contain GPS receivers and report position to ground stations using Amateur Radio□s APRS (Automatic Position Reporting System). Payloads can also include cameras, scientific instruments, and radio equipment for communications experiments. Many ballooning groups fly student-designed experiments as part of their missions.

Flights frequently achieve near-space altitudes of 80,000 feet or higher, endure very cold temperatures often lower than -70°F and atmospheric pressure less than 1% of that at the earth's surface. Flight distance can vary from a few to several hundred miles depending on winds aloft, and the flight□s path is predicted before launch. Amateur Radio High Altitude Balloon flights in the USA adhere to FAA regulations for unmanned free balloons.

Participation in GPSL 2005 is open to everyone interested in Amateur Radio High Altitude Ballooning regardless of experience in either Amateur Radio or ballooning. Updated GPSL 2005 information will be posted at http://www.superlaunch.org/. Direct questions to Mark Conner, N9XTN, via n9xtn@....

Short version:

July 1-3, 2005: Fifth annual Great Plains Super Launch (GPSL), Omaha, NE. Amateur Radio High Altitude Ballooning conference on Friday, July 1, and multiple simultaneous balloon flights on Saturday. Backup flight date is Sunday. See http://www.superlaunch.org for more information or contact Mark Conner N9XTN at n9xtn@....

1136. Balloon over Ohio

Yahoo group: GPSL (2002 — 2008)
Date: 2005-01-31 21:52:40 UTC
From: Gene Harlan
Topic: 1136 Message: 1136

So, who sent up the balloon this last Saturday in Ohio (or Michigan that ended up in Ohio)? I heard the packet on 144.34 MHz or I
would not have know about it at all. It was at 50-60K when I first heard it, and maybe 235 miles per the D7.

I have the callsign at home, and the callsign said a Michigan address.

Copied the balloon with my D7 to 111,400 some feet and it almost disappeared right after that. The next reading I had after the peak
was 100,000 feet and it seemed like less than a minute after getting the high reading. Seemed like it was falling fast.

Just surprised I did not see any chatter about that balloon. Maybe there is a balloon list I am not on????

Subject: [GPSL] Balloon over Ohio

So, who sent up the balloon this last Saturday in Ohio (or Michigan that ended up in Ohio)? I heard the packet on 144.34 MHz or I would not have know about it at all. It was at 50-60K when I first heard it, and maybe 235 miles per the D7.

I have the callsign at home, and the callsign said a Michigan address.

Copied the balloon with my D7 to 111,400 some feet and it almost disappeared right after that. The next reading I had after the peak was 100,000 feet and it seemed like less than a minute after getting the high reading. Seemed like it was falling fast.

Just surprised I did not see any chatter about that balloon. Maybe there is a balloon list I am not on????

What is the callsign? I'd like to extract the track from FindU.

Hi guys,

I think it was the Suntracker Balloon out of Ohio (KC8MSY) but they did
not transmit on the national APRS frequency and apparantly did not gate
their posits out to the Internet either. That's my guess anyway.

You know, I do stuff like that regularly and thank God that no one has captured it on film yet!

I'd give Paul an 8.5 for artistic impression and a 9.5 for effort for that event! No 10 because he apparantly escaped without fracturing any bones :-)

It may have been Suntracker XIII (KC8MSY) by Wayne State University which I put in our Launch Announcements last Thursday afternoon and updated on Friday. I checked FINDU and APRSWORLD several times on Saturday but did not find anything. A few minutes ago I tried to dump a raw file but found nothing.

They have not updated their web page with flight results. Perhaps they used another callsign(?) I tried -11 and * but no joy.

Here is the info on the Saturday Jan 29,2005 flight you are asking about.
73 Phil W8IC

The launch of Suntracker XIII will be from Portland, IN and is scheduled for 10:00 a.m., Saturday, January 29th. The latest forecast predicts surface winds of 7 mph, and a northeasterly range of 72 miles with a landing about three miles west of Warton, OH (N40.856, W83505). Please inform me if you are interested in assisting with the launch, recovery, communications, porting the data to the Internet, or recording data on 2 m or video on 70 cm. The hardware, frequencies and antenna orientations are available at www.suntracker.eng.wayne.edu. I may be contacted on 313.610.3038 on the day of the flight.
Thanks for your interest and notify me if you would like your name removed from the launch announcement or know of others that would like to be added to it.
Regards,
Jim KC8MSY

Hi All,

It was the KC8MSY Suntracker balloon out launched from Portland, Indiana....they were only transmitting on 144.34 and no one was I-gating it onto Findu....if anyone is in the Ohio/Indiana/Michigan area that would like to I-gate future Suntracker, I'm sure they were greatly appreciate it. I talked to Jim KC8MSY on his cell phone and this is what he reported on the recovery:

I believe it exceeded 111,000 feet and landed near Norwalk, Ohio and was quickly recovered in a field during the middle of a snowstorm (the local farmer had already found it).

Below is a summary of the Suntracker XIII flight. Data and photographs
will be posted at suntracker@... in the next few days.
Thanks to all who reported data and signal levels.
Jim KC8MSY

Launch Date: January 29, 2005
Launch Location: Portland Municipal Airport, Portland, IN
Launch Coordinates: N40 Deg. 27.849 Minutes
W84 Deg. 58.969 Minutes
Launch Conditions: Snowing with 4 Knot surface winds and an air
temperature of about 1 degree Celsius
Balloon: Kaysam 3000 gm inflated in hangar with
240 cubic feet of helium and transported in a plastic bag to airstrip
for launching.
Weight: 5.9 lbs. scientific package and 1.1
lbs. train. See suntracker@... for details.
Launch Time: 11:51 AM
Average Ascent Rate: 738 Ft./Min.
Burst Altitude: 111,448 Ft.
Burst Coordinates: N41 Deg. 2.394 Min.
W83 Deg. 3.747 Min.
Burst Time: 2:20 PM
Landing Time: 3:05 PM
Landing Location: 4.8 Mi. South-Southeast of Norwalk, OH
Landing Coordinates: N41 Deg.11.0862 Min.
W82 Deg 33.8985 Min.
Retrieval Time: 4:08 PM
Range: 136.04 Miles

Hi Chris,

Well, that's great news! Can we split off some of the StudentSat
payloads to the Upward Bound flight string to balance out the
two balloons to about 17 lb each? That will keep the landing sites
in reasonable proximity.

So far, the proposal to move Upward Bound from the 2 July GPSL date
to June 16/17 has been well-received by the EOSS crews, and many are
up for doing GPSL as well.

If I hear of no show-stoppers by this Friday 4 Feb, we'll make it so.

Thanks!

Hi Paul,

Well, we'd be delighted to have you out to work with us again!

I'm getting some pretty favorable responses from the EOSS teams
so far, and Chris Koehler has indicated that he expects less than
40 lb of combined student payloads, which we could split between
two 3000 gm heavies. That relieves us of the 1.5 hr span of low
wind to accomodate FAA's 45-minute launch interval.

So don't feel compelled to lend a hand unless you want to. You'd
welcomed in any event!

Future Scientists and Engineers of America [pdf]
http://www.fsea.org/

Future Scientists and Engineers of America (FSEA)is "a national non profit organization which provides the structure, project material, documentation and workshop training necessary to establish after school technology clubs in K-12 schools." The organization has selected programs that can be easily and readily implemented in every school to give students an opportunity to work in teams and experience practical, hands-on engineering projects in ways that mirror what an engineer or scientist would do. The program involves the community, including students, parents, schools, businesses, technical and civic organizations, and universities and colleges as well PTA/PTO organizations. Participants are part of a local FSEA chapter, which consists of a sponsor, mentors, FSEA student members, a teacher and a parent coordinator. Information on how to join or start a chapter are provided on this website, along with links to websites created by some schools that are part of the program. Handbooks, guides and directories are also available to download. The Science Challenge Questions offers a collection of projects and questions intended to promote learning of specific concepts as participants engage in the projects. A short description and the full plan for each project is available to download free of charge.

Encyclopedia of Educational Technology [pdf, Macromedia Shockwave Player]
http://coe.sdsu.edu/eet/admin/index.htm

The Encyclopedia of Educational Technology (EET), published by San Diego State University Department of Educational Technology, offers a collection of short multimedia articles from various authors discussing topics related to the fields of instructional design, and education and training. The materials are meant for "students and novices to intermediate practitioners in these fields, who need a brief overview as a starting point to further research on specific topics." The Table of Contents is divided into the following main topics: Cognition and Learning, Analysis, Design, Development, Implementation, and Evaluation. For each subtopic the site provides a short explanation and related video demonstrations, images, or examples to help explain the topic, and links to related topics. Visitors will find overviews of topics such as Vygotsky's Zone of Proximal Development (ZPD), eLearning, Web accessibility, and authentic assessment. The Bibliography lists numerous references (some with links to online articles) used in writing the entries in this encyclopedia.

1151. Roll call - GPSL attendance

Yahoo group: GPSL (2002 — 2008)
Date: 2005-02-14 16:13:24 UTC
From: n9xtn@cox.net
Topic: 1151 Message: 1151

I'd like to put together some attendance numbers and other logistical details for this year's GPSL. Please e-mail me the following, even if your group is just coming to watch:

1. Group name
2. # of flights (payload trains) your group will launch
3. # of people attending conference with your group (approx.)
4. # of helium tanks you expect to pre-order (K or T - don't include spares)
5. # and size of balloons you expect to pre-order

This will help me determine how big of a conference room we'll need for Friday. I have not yet been able to make contact with Dr Larson at UNO regarding use of their facilities. There are a number of community colleges in the area that could be used, however.

I'll update the GPSL page at www.superlaunch.org with the new info once I have it compiled. I have not yet sent the "press release" to the various magazines, but hope to do so this week.

I'll be there under my name.
I'll launch just one flight
I'll bring just myself
I'll need a tank and a half
I'll bring a 1500 gram balloon

I'm a Solar System Ambassador for JPL now, so I'd like to present on the Deep Impact mission during my presentation.

Paul

Hi Mark,

Our responses to date:

1. Egde of Space Sciences
2. One
3. 5 committed to date, possibly up to 10 (TBD)
4. 2 @ K bottles (400 ft^3)
5. none (we will bring our own plus a couple of pibals).

For EOSS: So far, I have comittments from W5VSI, N0KKZ, WA0GEH plus
a couple others I failed to note at the last meeting. Let me and
Mark N9XTN know at your earliest convenience if you plan to join us
at GPSL 2005 in Omaha NE July 1-3 '05. I expect there'll be a few
spare seats in the EOSS convoy if you don't want to drive solo.

1. Project: Traveler
2. 1 Flight
3. 1-2 attending the conference
4. We're not sure what we'll be flying, but we'll probably use a single
K or T tank.
5. Are you supplying the balloons? Again, I'm not sure what we'll be
flying, but we'll probably bring our own.

You have had repeated participation in NSTAR flights by others from the Des Moines area that may be interested in attending. Perhaps these folks should get a special direct invitation from you so they will know they would be welcome.

If a slot is available I could cover Thermal Engineering of Floating Payloads -or- Supplementing Battery Power for Floating Payloads with Light Weight Solar Panels -or- both.

Do you intend to arrange for, encourage and announce poster displays? At a minimum this would require space and tables in an adjacent room that could be locked if needed. It seemed to work well in the meeting room at KSU which was large enough to allow displays in the same room as discussions.

1162. Balloon order for GPSL (probably not)

Yahoo group: GPSL (2002 — 2008)
Date: 2005-02-15 17:07:00 UTC
From: n9xtn@cox.net
Topic: 1162 Message: 1162

It appears most groups (so far) are planning to bring their own balloons for GPSL. I will probably need to send an order to Kaymont sometime in late May or June for my own purposes anyway, as I'll be out of 1200g balloons by then.

I'll bring whatever extras I have on hand to the GPSL launch - should someone need a spare for whatever reason they'll be on site and we can negotiate an extorted price for one. :)

1164. GPSL announcements sent

Yahoo group: GPSL (2002 — 2008)
Date: 2005-02-16 15:10:31 UTC
From: n9xtn@cox.net
Topic: 1164 Message: 1164

I've sent announcements regarding GPSL to the club contacts I could get from the ARRL site for eastern Nebraska, southwest and central Iowa, and northwest MO. I also sent it to the Nebraska section manager (will do so for Iowa's too).

At the same time, I sent it to QST, CQ, CQ-VHF, and AMSAT.

We have the following groups as "definite" or nearly so for attendance:

NSTAR
KD4STH
EOSS
Project:Traveler
WB8ELK
HABITAT/SkyLab
HARPO(sp?) (don't have the e-mail on this system, but you're on the list)

These are tentative:

ES-OS
KD0FW (Kansas City ATV)

CAP-N-SPACE (KC area) expressed an interest earlier, but I haven't heard from them yet.

No KS clubs? ;-)

I'm sure Orlan Cook W0OYH, would put it in his KAR,
Kansas Amateur Radio. It is his ARRL Section
newsletter. I know there is interest in KS too.

Orlan, our next balloon launch is scheduled for
3/13/05 10 a.m. at Joe's place (normal launch site).

Just a suggestion, I know you can't send it to
everyone,

I was curious if anyone would have any extra lifting capacity for the July 2 launch. I'm planning on having my payload completed by then. It should weigh in about 4 - 5 lbs. I was hoping to have a launch under my belt by that time, but so many other things seem to get in the way of fun. I met with Mark, N9XTN, this past weekend and he suggested flying piggyback with another "proven" payload once or twice, before trying it solo. I'm from Grand Island, NE and I'm hoping to get some folks in my area excited about this hobby. So far it's been a solo project, but I've got a small group inteterested. We're unofficially CNNSP, Central Nebraska Near Space Program.
I'd gladly share the expense of the balloon and helium.

Hi, we are a relatively new group based in NYC (Medgar Evers College, CUNY), MECSAT. (We actually launch in upstate NY and Northern Vermont.) We got our feet wet at the Colorado BalloonSAT workshop last summer and started our launch program right after. We did receive information about the GPSL from our state Space Grant and we're interested in participating. I tried to email the contact person but for some reason the email bounced. Can we still participate? We would be willing to partner with someone as well since we don't really know the area.

1173. Re: [GPSL] GPSL participation

From: Mike Manes
Topic: 1172 Message: 1173

Hi,

Well, it certainly is gratifying to learn about new balloon groups being spawned from Chris Koehler's BalloonSat Workshop! EOSS is proud to have played a small part in that effort, and will be glad to work further with
you at GPSL. Not sure at this point what our payload complement will be,
but I expect that we'll already be loaded close to the 12 lb FAR-101 exempt limit on that one. So it's unlkely that EOSS could carry any "hitchikers" weighing over 500 - 600 gm.

But there may be some others with spare weight budget, or your group could
bring along its own balloon and payloads. Rest assured that the GPSL teams
will not rest until all the payloads are recovered. Just be sure you have
a 2m ham band beacon, DF or APRS, aboard. Mark will be overseeing freq coordination.

This year's GPSL is being monthered by Mark Conner, N9XTN, of NSTAR out of
Nebraska. He's cc'ed on this email, so he should be getting your echo. If you will flying, place an order for He with Mark.

I'd encourage your team to prepare a brief (15 - 20 minute) presentation on your startup experiences. There will be a number of amateur balloon groups there who would be delighted to work with nearby Space Grant Colleges. I gave a pitch on that topic at last year's GPSL in KS.

Hi,

Not sure why the e-mail bounced, but thanks for putting your message on the GPSL list.

You're more than welcome to participate in this year's GPSL. The groups flying this year are probably going to be full-up on their own payload strings, but we'll certainly provide mutual aid for tracking and recovery.

There's not a lot to know about the region for balloon chasing - one-mile road grids and few trees make it pretty easy in relative terms for recovery.

Be sure to let us know the details of what you plan to fly as the date gets closer. At some point in the next few weeks we'll start the frequency and time slot coordination process. We may have a lot of balloons in the air at once this year!

BTW, how did you hear about the GPSL?

Hi, we are a relatively new group based in NYC (Medgar Evers College, CUNY), MECSAT. (We actually launch in upstate NY and Northern Vermont.) We got our feet wet at the Colorado BalloonSAT workshop last summer and started our launch program right after. We did receive information about the GPSL from our state Space Grant and we're interested in participating. I tried to email the contact person but for some reason the email bounced. Can we still participate? We would be willing to partner with someone as well since we don't really know the area.

Dr. Shermane A Austin, KC2NAZ
Associate Professor - Physical, Environmental And Computer Sciences
Medgar Evers College, The City University of New York (CUNY)

Dr. Austin,

Thanks for introducing us to Medgar Evers College MECSAT high altitude balloon program. I look forward to MECSAT participation during GPSL-2005 this summer. Continue to check for new details at http://www.superlaunch.org/.

FYI, a gathering in the Washington, D.C. area of high altitude balloonists has recently been announced. See http://patkilroy.com/simsat/symposium/ for more information about this symposium at the NASA Goddard Space Flight Center in Greenbelt, MD.

I Googled 'balloon' from http://www.mec.cuny.edu/default.asp to find your MECSAT web page at http://nrts.mec.cuny.edu/mecsat/ but my attempts to connect have been refused. With your permission I would like to add MECSAT to my ballooning links page at http://users.crosspaths.net/~wallio/HABLinks.html if your page is accessible.

Given notice of your future MECSAT flights I will be happy to add them to our collective Launch Announcements at http://users.crosspaths.net/wallio/ARHAB%20Launch%20Announcements.htm.

You and your students may also be interested in our collective Amateur Radio High Altitude Ballooning Records maintained at http://users.crosspaths.net/wallio/RECORDS.htm. You are welcome to submit entries for past and future MECSAT flights.

Hi, all. I didn't change my group email so individual replies didn't come to the group.
We're still pretty new at this and our URL is:
http://nrts.mec.cuny.edu/mecsat
We want to fly our own balloon at the GPSL because we need the practice and the terrain is better than what we normally have. Plus the tracking support will be really helpful. I was really impressed with the EOSS folks in Colorado and I'm glad to hear that they're involved in this also. We are willing to partner with anyone that wants to piggyback on our balloon. We're flying student experiments and doing some testing so I don't know the payload weights just yet but will provide info as soon as we're able to determine this.

1180. UAH Balloonsat Flight found near Rome GA

Yahoo group: GPSL (2002 — 2008)
Date: 2005-04-03 19:21:37 UTC
From: wb8elk@aol.com
Topic: 1180 Message: 1180

We only flew the first balloon today (StratosFear) since the 3Mall team wasn't ready to fly.

Beautiful weather today with barely any surface winds. It was so clear that the balloon burst was visible from the ground and the parachute could be seen as it descended through 50,000 feet.

We're not sure if the student cutdown system worked since they fired it after balloon burst so it will have to be analyzed to see if it fired when they get it out of the tree.

However, N4TXI's parachuting Buzz Lightyear was successfully dropped via a remotely controlled servo mechanism at 80,000 feet via a packet uplink to Gary's newly designed packet board based on the Atmel AVR Mega 8 (called the WhereAVR)....details on it's construction and open-source code can be found at: http://www.garydion.com. The nice thing about this APRS controller is that it is a single chip solution that includes the capability of receiving packet commands as well as APRS and telemetry downlinks.

The balloon landed 10 miles west of Rome, GA:

34d 16.727m
85d 22.455m

There is an APRS object called UAHfound on Findu as well.

http://map.findu.com/uahfound

It landed 40 feet up in a tree near a small clearing...the recovery team is trying to retrieve it currently.

73s de Bill WB8ELK

There will be 3 flights next Saturday....callsigns and payload configurations will be announced later in the week.

1181. GPSL flight list

Yahoo group: GPSL (2002 — 2008)
Date: 2005-04-03 22:34:37 UTC
From: Mark Conner
Topic: 1181 Message: 1181

Here is a list of groups who I have down as planning to fly at the GPSL:

*
NSTAR

*
EOSS

*
Project: Traveler

*
HABITAT/SkyLab

*
WB8ELK

*
KD4STH

*
Project HARPO

*
Central Nebraska Near Space Program (piggyback with another flight)

*
MECSAT (tentative?)

*
ES-OS (tentative)

*
CAPNSPACE (tentative)

If there are changes to this list (either in name or how definite your plans are), please let me know. Also, please start thinking about the RF-emitting payloads you plan to fly. We might have to look at a third APRS frequency (144.365? halfway between .34 and .39) to handle all the traffic.

Date: 2005-04-04 01:08:56 UTC
From: Rochte, Robert
Topic: 1181 Message: 1183

Please put the Grosse Pointe Academy on the tentative list. We would only have a few people come out (me and one or two others) and would plan to fly a moderately-sized solar Montgolfier with a simple APRS tracker (basically a demonstration flight).

Thanks.

Regards,
Robert

Congrat's on the flight!
GLuck next weekend.

If I can get my mobile tracker going we will also fly next weekend.
I am having a problem with APRS+SA (WNT) on my new laptop running
Win2000P. For some odd reason it will not display certain stations.
The packets comom\ng in are fine in the terminal screen, but they
won't appear on the History or Position screen. If anyone has any
ideas what is causing this I would appreciate a workaround!

Date: 2005-04-05 21:35:11 UTC
From: n9xtn@cox.net
Topic: 1190 Message: 1190

An updated list:

-
NSTAR

-
EOSS

-
Project: Traveler

-
HABITAT/SkyLab

-
WB8ELK

-
KD4STH

-
Project HARPO

-
Central Nebraska Near Space Program (piggyback with another flight)

-
MECSAT (tentative?)

-
ES-OS (tentative)

-
CAPNSPACE (tentative)

-
ORB (tentative)

-
Univ. of Kansas High Altitude Balloon Satellite (KU HABS) (tentative)

-
Grosse Point Academy (tentative - solar Montgolfier)

-
Taylor Univ. (tentative)

So that's 7 fairly definite flight trains, 1 as a piggyback flyer, and 7 more who are at the "maybe" stage.

I just spoke with Mike Larson at UNO and we're at the 98% definite level that we'll have a classroom at UNO (see www.superlaunch.org (http://www.superlaunch.org) for where the UNO campus is in Omaha). We should also have wired Ethernet and/or WiFi access too. We may be able to get parking passes, but if not there's a nearby garage that's pretty empty in the summer and costs only 75 cents to get in.

I would like to suggest that we eat at the UNO cafeteria for lunch. Mike is checking on that too, but it looks promising. This will save a lot of driving around and competing with nearby office complexes for space at lunchtime (there are two hospitals and at least four major office buildings within a half-mile range of the restaurants on 72nd Street).

So far I have only two "formal" presentations on the list of possibilities, both by Ralph W0RPK (my apologies if someone else has volunteered to do a talk and I've forgotten it). I also plan to include at the end of the afternoon a weather briefing/launch site decision meeting. This should hopefully get everyone on the same page as to what to expect for winds, weather, and flight tracks. We should also have time for individual groups to highlight their accomplishments. If you have a presentation you'd like to give (either "formal" or "what we did last summer"), let me know the topic and how much time. Also, if some of the newer groups would like to suggest a topic, throw it out on the list and perhaps someone will volunteer to take it on.

Another possibility is to have more "unstructured time" in the schedule. I've been to a number of meteorology conferences where the best information is to be had by BSing with the other attendees in the hallways. We can just build that into our schedule, perhaps right after lunch.

Content-Type: text/plain

I had an experience I want to share with the group. Several of you know me...many of you don't. I have a passion for teaching (I am a band director by trade for 20 years) and public service (have been working with the local NWS for about 10 years). I understand about educating "the masses"...but sometimes we go over board. Sometimes it is what we read for weeks at a time. I have not just stumbled onto APRS...but have been involved in one form or another. No, I do not consider myself as an expert...but I do feel that I have brought a few people into this portion of the hobby because of my involvement. Yes, some have come and gone...but it is nice to see a "newbie" (sp?) get as excited about it as one did today.

This is going out in a 2 part email because the people who put this on...do not deserve to be listed in this email.

Today a friend of mine, who just happened to have worked with NASA on the Saturn V project, came on the local repeater as I was watching and waiting for the balloon launch from Huntsville,Al. All of a sudden a balloon popped on my map...50,000+ feet. I was just causally talking with him...and then mentioned this. His voice raised to a higher pitch and said, "What are you looking at?". Knowing that he didn't have APRS (he had a station on...but had long ago turned it off), I pointed him to findu.com (thanks Steve!). You would have thought it was Christmas for this older gentleman. It was like watching a horse race! I kept going back and forth on my APRS station and findu. Literally the balloons were racing each other....we could not get enough. We held our breath as they went over a large lake in N.Al. When the payload stopped sending telemetry (sp? too tired to check ;-), we started watching the chase vehicles. I noticed a packet from a guy down in Fl that saw it direct...cool! I brought up my remote base on our repeater to see if I could hear the voice simplex repeater...no such luck. Everyone of them however we could see direct...which I thought was neat....so did Gary.

Fast forward to tonight....
Heard some guys talking about studying code and I threw in my 2 cents worth. Before I could barely unkey...Gary jumped in wanting to know, "Did they find the balloons?" "Did you see that they landed almost side by side?" ....he just would not stop. ;-) I thought..."Let's go look on the SIG archives and see if we can find something on it...", since I get the SIG in digest mode. I talked him thru each mouse click to get there. Found it! Clicked on "Balloon Unproto Paths"...or something like that.

Did we find it? No. The tone of his voice...I could tell he was disappointed. All he saw was people "fussing" over unproto paths.

I wonder how many others feel this way? Folks, I understand that somethings may need "fixin'"....but let's promote APRS for the really cool things that it can do....and stop with the bickering and fighting over what works best. There are several people who have "slapped" my hand over wrong practices with this thing called APRS over the years...and I thank them. However....after a while pounding and pounding the dead horse....come on...it is already glue!

Part 1 over...flame away....I won't be responding....

I would like to thank the guys up at UAH in Huntsville,Al. I know myself and Gary (KB4RG)...& probably several others that were listening on a local S.ATL repeater...was glued to our computers for hours today. I know alot of hard work and MONEY went into your project. I hope that you would share with the group your experiences about today's flight. I know that several others have before...honestly it just really didn't catch my attention until today. Wow! How cool is this!! 92,000+ feet at one time. Just plain slick ;-) I know others have gone higher..and such. Ralph (N4NEQ)...neat page :-) Looked on the web and found your site with the NASA stuff...cool with the peeps too ;-) I also shared that with Gary.

What a neat thing to do on Field Day. Just wish we didn't have a major airport...and the FAA at our door step 8-)

Great job guys....and it was neat to hear an old NASA engineer get excited about APRS again....

Good Night and 73,
Robert

Thanks for the wonderful story Mark. I read few of the
Sig postings a while back and it seems there are always self
proclaimed APRS police trying to force others to do it
THEIR way. Several HAM's in the Tulsa area have received
emails from one of these APRS cops, telling them how to
run their APRS stations when there was nothing wrong with
what they were doing, I've had several calls asking who does
guy think he is. He and others like him have turned APRS
newbies away from APRS. Education is the key. We as
APRS Elmers can help keep APRS growing.

That's my story and I'm stick'in with it! :)

1195. Comparing balloon prices - request for input

Yahoo group: GPSL (2002 — 2008)
Date: 2005-04-12 15:54:27 UTC
From: Ralph Wallio, W0RPK
Topic: 1195 Message: 1195

Perhaps we should compare recent balloon purchasing experience to understand any price differences between Scientific Sales (https://secure.scientificsales.com/Details.cfm?ProdID=129&category=8) and Kaymont (http://www.kaymont.com/pages/home.html) for the same balloons manufactured by TOTEX in Japan.

Scientific Sales has on-line ordering with the following prices (which include shipping and handling):

300 grams $30.00
350 grams $35.00
500 grams $45.00
600 grams $60.00
700 grams $70.00
800 grams $75.00
1000 grams $90.00
1200 grams $110.00
1500 grams $125.00
2000 grams $249.00
3000 grams $395.00

What is recent experience of Kaymont prices for the same balloons? What was charged for shipping and handling?

While we are at it, what is recent experience of Kaymont and Scientific Sales order response, e.g., have orders been shipped immediately, did they have stock at the time of order, et al?

I will gather responses into another e-mail message.

In my last order from Kaymont, I paid about $55 for a 1200 gram balloon.
Shipping was $5 as I recall.

Usually the service is good. But it looks like if you place an order at
the same time as the government, you'll get lost.

Paul

According to the fellow at Scientific Sales....the balloons are not the same as those sold by Kaymont.

Kaymont sells Totex balloons made in Japan.

Scientific Sales sells balloons by "The Weather Balloon Manufacturing Company" also made in Japan.

These two weather balloon companies are seperate entities although they look like they are made in the same manner.

I've found that the Scientific Sales ballooons are very consistent....we typically have 18 to 19 pounds of lift in our balloons for the student experiments and the last few have burst within a thousand feet of 95,000 feet (the ones that weren't cut down).

I haven't tried comparing the Kaymont balloons yet.

Kaymont has been very responsive in the past for me.

Scientific Sales has been very responsive as well.

There are times that I've had trouble getting 1500 gram balloons with either company though.

In January I ordered and received two 2000 gram balloons from Scientific Sales....but the 3000 gram ones were a long lead-time special order.

Kaymont may have a quicker way of getting the 3000 gram sizes but I haven't checked yet about this...we've ordered 3000 gram balloons from them in the past however for the NASA Leonids experiments and those seemed to be very consistent as well...not sure about the availabililty of 2000 gram balloons.

Perhaps it would be a good experiment to fly two payloads of the same weight with a Scientific Sales and Kaymont balloon on each to compare their performance...although I expect that they would be pretty close. It's been my experience that Kaysams go a bit higher for the same lift but they are harder to launch successfully in a strong wind....however they are out of business.

World Year of Physics 2005 Newsletter - April 2005

"Help Make 2005 Another Miraculous Year"

****
In this issue:

1. Physics Enlightens the World

2. Einstein@Home makes it onto 100,000 PCs

3. Searching for the next Einstein

4. WYP Promotional Kits

5. WYP Merchandise

6. 2005 Event Finder now online!

****

Happy World Year of Physics 2005! Many exciting things are happening during 2005. Check our website for the latest details regarding our projects. http://www.physics2005.org

You're receiving this message because you signed up to be on the list at our website or at an APS, AAPT or other scientific meeting. This newsletter, containing information about the World Year of Physics 2005, is distributed approximately every six weeks.

1. Physics Enlightens the World---Last Chance to Participate!!

In the World Year of Physics 2005 as many people as possible should get the feeling to be part of a great physics community spanning the whole globe. "Physics enlightens the world" is an endeavour to achieve just that: A world-wide relay of light to commemorate the 50th anniversary of Albert Einstein's death on next Monday, April 18, 2005. For more information, click on: http://www.physics2005.org/events/projects.html

2. Einstein@Home makes it onto 100,000 PCs

Einstein@Home--our distributed computing project to search for gravitational waves--was officially launched on February 18. We have 72,337 registered users so far who have volunteered time on a total of more than 100,000 computers. Participants currently represent over 140 countries. The raw computational capacity of the participants' CPUs is over 85 TeraFlops (floating point operations per second), which exceeds the capacity of IBM's Blue Gene L (70.72 Tflops), the record holding, stand-alone supercomputer. Join in the search for gravitational waves today! Sign up at: http://www.einsteinathome.org

3. Searching for the next generation of physics talent

The World Year of Physics 2005 Physics Talent Search project is now beginning in earnest. Both students and evaluators are urged to participate (evaluators must be members of APS or AAPT). Students' results are due by July 31, 2005. All awards and recognitions will be completed by the US Organizing Committee no later than 15 September 2005. Sign up today at: http://www.usphysicstalentsearch.org

4. WYP Promotional Kits

Now that the World Year of Physics 2005 is upon us, how about getting an official World Year of Physics 2005 Promotional Kit! Kits include lapel pins, magazines, balloons, pens, glasses and posters, or you can purchase individual items as you require. These items work great as door prizes, science awards for your graduates, or fun give-away items for volunteers at demo shows or at formal events. Order your kit online at: http://www.spsnational.org/societynews/2005WYP_shirts.htm

5. WYP Merchandise

Get your WYP2005 Merchandise now! Watches, T-Shirts, Umbrellas, Baseball Caps and more... Get your cool stuff today at: http://www.aapt.org/Store/products.cfm?category=world%20year%20of%20physics

6. Register your event on our 2005 Event Finder!

The WYP2005 Online Event Finder is available. We want to hear about YOUR World Year of Physics event in the United States. Add your open house, public lecture, lab tour, or physics demonstrations to our online event finder so others in your area (and around the country) can find out about your events.

Click here to submit your events: http://www.physics2005.org/events/submit.html

****

For more information on the World Year of Physics 2005, email vinaya@... or visit our website at http://www.physics2005.org.

If you would like to be removed from this list, email physics2005@... with the word REMOVE in the subject line.

1200. Comparing balloon prices - collected comments

Yahoo group: GPSL (2002 — 2008)
Date: 2005-04-18 11:32:09 UTC
From: Ralph Wallio, W0RPK
Topic: 1200 Message: 1200

Thanks for all comments and information. Complete responses are collected far below. I have extracted several comments about pricing, service and other issues immediately below.

It seems clear that Kaymont pricing is significantly less than Scientific Sales:

BALLOON SS(includes s/h) Kaymont (s/h extra)
300 grams $30.00 $15
350 grams $35.00
500 grams $45.00
600 grams $60.00 $25
700 grams $70.00
800 grams $75.00
1000 grams $90.00
1200 grams $110.00 $55+$5s/h $50-55
1500 grams $125.00 $87 or $97 $75 $75 $70
2000 grams $249.00
3000 grams $395.00 $230 $225

Pricing comments:

Current Kaymont quote for KCI-3000 $230 plus s/h (Mike Cook, KC0GMJ - ISU HABET)

Last order from Kaymont [no date] KCI-1200 $55 plus $5 s/h (Paul Verhage, KD4STH)

Kaymont quoted $87 (it might have been $97) for a KCI-1500 [no date] (Troy Campbell, KC0MIC - CAP-N-SPACE)

Last summer [2004], I paid about $50-55 for 1200g balloons and $75 for 1500g from Kaymont. I believe on my order of four that shipping was $10 or $15. (Mark Conner, N9XTN - NSTAR)

Kaymont $75 for their smallest sounding balloon, a 1500g one I think [no date] (Chris Valade, KB1LTH)

Kaymont KCI 300 15.00 - KCI 600 25.00 - KCI 1500 70.00 - KCI 3000 225.00 (government contract prices) (Gerald Lehmacher, KI4CQJ - Clemson Univ TigerCUB)

It seems clear that Kaymont service is reasonable:

"I have almost always been pleased with their [Kaymont] response." (Mike Cook, KC0GMJ - ISU HABET)

"Last year [2004] I got two 1200's and two 300's. Response was fast, and so was shipping." (Andy MacAllister, W5ACM - BLT)

"Usually the service is good. But it looks like if you place an order at the same time as the government, you'll get lost." (Paul Verhage, KD4STH)

"Kaymont has been very responsive in the past for me." (Bill Brown, WB8ELK)

"[Kaymont]1200s and 1500s were in stock and order to delivery was just over a week ..." (Mark Conner, N9XTN - NSTAR)

Related comments:

"Scientific Sales sells balloons by "The Weather Balloon Manufacturing Company" [not TOTEX as from Kaymont] also made in Japan." (Bill Brown, WB8ELK)

"I've found that the Scientific Sales ballooons are very consistent...." (Bill Brown, WB8ELK)

"As far as I could determine, balloons sold by Kaymont did not have serial numbers and it was therefore not possible for Kaymont to determine the date of manufacture nor the composition of the balloon." (Jim Woodyard, KC8MSY - Wayne State Univ SUNTRACKER)

"I would welcome a technical contact at TOTEX to optimize balloon designs for our project." (Jim Woodyard, KC8MSY - Wayne State Univ SUNTRACKER)

Ralph,

We currently have an order pending from Kaymont. It is for 3000 gram balloons - the price quote is $230 less shipping. I have almost always been pleased with their response. Except for large balloons, they usually have them in stock (seems to have been a problem in the last year). We normally try to have around 10 balloons on hand at any given time because of the time lag that we have experienced.

Subject: RE: Comparing balloon prices - request for input

Ralph,

We do not need more balloons this year. In 2003 I could barely get a few 300 gr balloons from Kaymont. They could not ship 1200's. I think I may have gotten one 1000. Last year I got two 1200's and two 300's. Response was fast, and so was shipping. This year my primary 1200 is a year old and my backup is 3+ years old. I only seem to have one 300 on hand. It was NATO surplus via eBay, but it was the same Kaymont (Totex) balloon in a NATO outer foil wrapper! It's a few years old, but it looks good and will be used for a non-critical flight. I have only dealt with Kaymont. The other folks sound too expensive for our budget. We have $145 in the "jar", BUT we own our HE tanks this time - special deal.

Check out the info at:

http://www.qsl.net/w5acm for BLT-21 stuff.

Subject: Re: Comparing balloon prices - request for input

Ralph,
Thanks for carrying out this survey. It is an excellent service.
I used Kaymont balloons when we started the Suntracker project in 1999 . I requested on several occasions the date of manufacture of the balloons that I purchased. I did not receive a response. As far as I could determine, balloons sold by Kaymont did not have serial numbers and it was therefore not possible for Kaymont to determine the date of manufacture nor the composition of the balloon. The composition is important in order to optimize the balloon performance for a given flight, e.g., day or night flights, launching in high surface winds etc. While the user does not need the composition, the manufacturer needs a batch number etc. in order to optimize the composition.

Failing the availability of technical information from Kaymont,
Kaysam balloons were purchased. Kaysam was forthcoming and
cooperative. I purchased a number of balloons that were custom designed
for our experiments. Now that they are out of business, I would welcome
a technical contact at TOTEX to optimize balloon designs for our project.
Thanks,
Jim Woodyard

My last purchacse was from Kaysam, 1500gr for $63.00
When I found out that Kaysam was going out of business
I called Kaymont. The called back and quoted $87
(it might have been $97).
The response time was pretty good though I haven't
purchased any yet.

Kaysam was selling 1000-2000g balloons for $40-$100. MUCH cheaper than Kaymont's prices. Unfortunately they are going out of business soon if they
haven't already. I managed to get 8 100g balloons from them for $8.26 a piece.
I called up Kaymont a while back and they wanted $75 for their smallest sounding balloon, a 1500g one I think.

We really need some guy out there to figure out how to make these things in his garage for $10 a piece.

This is what I was quoted last year from Kaymont. But these were government contract prices. Items were in stock and delivered promptly. 3000 g balloons had 75 days delivery time. I purchased 300, 600, and 1500 g balloons.

KCI 300 15.00
KCI 600 25.00
KCI 1500 70.00

update your address book, ka0jlf@... is what I
use mostly for this type stuff. It is what my GPSL
list sends too. That's how I got this, I guess.

Thanks! 73,
Don

1202. Fire In The Sky 2005 Rocket Launch PRESS RELEASE

Yahoo group: GPSL (2002 — 2008)
Date: 2005-04-19 22:22:16 UTC
From: Robert Nech
Topic: 1202 Message: 1202

Washington Aerospace Club

http://www.washingtonaerospace.org

Date: 14 April 2005 FOR IMMEDIATE RELEASE

PRESS RELEASE

Contact: Jim Wilkerson, Launch Director email: fits2005@...

FIRE IN THE SKY 2005 REGIONAL ROCKET LAUNCH

Mansfield, Washington

Memorial Day Weekend, May 28-30, 2005

The public is cordially invited to the Pacific NW?s premiere regional rocketry launch to kick off the rocket flying season during the Memorial Day weekend. Each year rocketeers from around the region and points more distant gather here in Mansfield, Washington to fly rockets ranging from model to very large high power rockets. Bring your own rockets to sharpen your flying skills here or simply watch some of the Pacific Northwest?s best rocketeers at work flying their rockets up to 17,000 feet above the ground at speeds well over Mach 1!

In addition to individual rocket flying there will be several other activities such as:

o NAR-certified model rocket contests

o Can-loft contest

o Night rocketry launch

o Rocket building workshop for the Douglas County youth

o Astronomy classes and star gazing with telescopes sponsored by the Tacoma Astronomical Society and taught by Joe Witherspoon

o BalloonSat/PongSat Workshop: Learn to build and fly a payload via weather balloon to 100,000 feet with recovery sponsored by the Treasure Valley Near Space Program and taught by Paul Verhage

o Raffle prizes

Admission is $5/day, $10/weekend (or $20 per family). Launching of rockets will commence each day at 8:00AM. On-site dry camping is available (no RV hook-ups).

Come on out to Mansfield for a great weekend of rocketry ? Fire In The Sky 2005!

# # #

If you would like additional information, please view the Fire In The Sky 2005 webpage at www.washingtonaerospace.org/fits2005.php.

If you would like to be removed from this once a year mailing, please reply and putting the word "REMOVE" in the subject line. Regards, Robert.

1203. Kaysam balloon closeout bargains

Yahoo group: GPSL (2002 — 2008)
Date: 2005-04-21 06:36:17 UTC
From: wb8elk@aol.com
Topic: 1203 Message: 1203

Hey All,

Kaysam still has a number of 3000 gram and a couple of 2000 gram balloons left that you can probably get for a bargain. I just bought 10 of each for a little over $100 each. As of yesterday they had 34 of the 3000 gram and 4 of the 2000 gram balloons....once they sell their remaining balloon stock they are closing their doors....they also have a quantity of smaller balloons available as well. They'll probably be open for a week or so and then that's it.

- Bill WB8ELK

1204. Kaysam nearly sold out of 3000g balloons

Yahoo group: GPSL (2002 — 2008)
Date: 2005-04-21 17:57:18 UTC
From: Mark Conner
Topic: 1204 Message: 1204

I just called Kaysam to order a 3000g balloon (was $200). There is one (1) 3000g left and no 2000g or 1500g balloons available as of 1245 CDT today. I did not ask about smaller sizes.

Comments from Merle McCaslin, K0YUK, EOSS:

----- Original Message -----
From: "merle mccaslin" <mmccaslin@...>
To: "Ralph Wallio" <wallio@...>
Cc: "Bill Brown" <wb8elk@...>; "Mike Manes" <manes@...>
Sent: Tuesday, April 19, 2005 9:36 PM
Subject: Fw: Attached Files

Ralph, Bill Brown
Mike Manes sent me your e-mail about balloons. Here are my comments

We have bought a few balloons from Scientific Sales the first couple of
1200 gram balloons were ok. Last year we had some bad results with
S.Sales
Here are the pictures of the 2000 gram balloon from Scientific Sales.
as found on launch day. The nozzle was cut off and the hole was marked
as you see when we opened the bag.
What I actual ordered was a 1500 gram balloon.
When I asked for a refund they told me fine the check would be in the
mail after 6 month and at least three calls no money. I called and asked
them to send me the value in pilot balloons. Which they did.

Also we have been flying a lot of 3000 gram balloons with 20 to 25 lb
payloads with poor results with altitude from Scientific Sales balloons as
compared to Kaymont.

1st 3000 S.Sales balloon with 25.3 lbs leaked and was floating at 40,626 ft
and had to be cut away
2nd 3000 S.Sales balloon we had a light payload for JATO of 12.95 lbs and it
burst at 77,480 ft.

With the Kaymont balloons 20.5 lbs the highest was 104.975 ft.
15 flights with Kaymont average of 23.66 lbs with average
altitude of 86,551. One burst early at 65,000 lowered the average.
So no more Scientific Sales balloons for me.

As far as availability it seems to be what is in stock or wait until the are
shipped from Japan. We are trying to place our orders several months in
advance.
The price for Kaymont (Totex) 3000 gram balloons in January was
$240.00 plus shipping.

I understand Kaysam is out of business.
Also Raven is now Areostar still have the same plastic balloons.

That has been our experience for what it is worth.
Merle McCaslin
EOSS

My comments:

I recently ordered a 100g from Scientific Sales via their web page. It arrived in a few days and the balloon appears to have no problems. It will soon be used to determine loss of lift over time due to helium migration through latex (more later).

The following table compares specified burst diameter and derived burst volume for 100-3000g balloons from Kaymont and Scientific Sales:

SPEC SPEC CALC
BARELY BURST BURST
SIZE DIA cm DIA cm VOL m^3
g SS KCI SS KCI SS KCI Compared
100 35 34 133 196 1.2 3.9 - 225%**
100 35 34 175 196 2.8 3.9 -39.3%**
200 48 55 270 300 10.3 14.1 -36.9%
300 60 69 390 378 31.1 28.3 + 9.9%
350 70 75 430 412 41.6 36.6 +13.7%
450 NA 86 NA 472 NA 55.1 NA
500 83 91 540 499 82.5 65.1 +26.7%
600 93 100 600 602 113.1 114.2 - 1.0%
700 102 109 650 653 143.8 145.8 - 1.4%
800 108 117 680 700 164.6 179.6 - 9.1%
1000 115 131 770 786 239.1 254.3 - 6.4%
1200 127 144 890 863 369.1 336.6 + 9.7%
1500 140 161 1000 944 523.6 440.5 +18.9%
2000 160 184 1100 1054 696.9 613.1 +13.7%
3000 190 227 1350 1300 1288.3 1150.4 +12.0%

[1] Scientific Sales (SS) specified as "uninflated diameter"
Kaymont KCI-series specified as "Barely Inflated Diameter"

[2] Specified BURST diameter

[3] Calculated BURST spherical volume

[4] Relative increase %
+ SS is larger -KCI is larger

** 133cm for SS100g is too low. Doubling of size (weight) should increase surface area by ~42%. Working backwards, SS100g burst diameter should be ~175cm.

Note that there is a wide range of differences in specified burst diameter and derived burst volume for balloons of the same size (by weight). Scientific Sales appears to have a consistent edge 1200-3000g (but remember that they cost a lot more). All other things being equal, greater volume capacity will yield higher burst altitude. The 18.9% advantage for a

Scientific Sales 1500g would add about 4kft to burst altitude in the 90-95kft range for a typical exempt flight.

1208. Photo Essay of Flight #20 "Reach For Space" are posted

Yahoo group: GPSL (2002 — 2008)
Date: 2005-04-27 15:48:29 UTC
From: Jerome Doerrie
Topic: 1208 Message: 1208

A photo essay of Flight #20 of the Perryton High School ?Reach For Space? program is posted at url; http://almostangels.org/balloons/.

There has been some discussions on the need for a lense cover or something attached to payload containers to protect the camera inside. As an experiment an inexpensive Vivitar 3350 digital camera was taped to the outside of our ten meter beacon package. For a low resolution digital, the photos are great. The only modification to the camera was to have an ider pic chip for a beacon snap the shutter every 60 seconds. Fortunately for us, the stock batteries did not freeze and condensation was not a problem. See the web site for more details about the flight.

Jerome Doerrie, K5IS

I have received an e-mail from Dr Larson indicating we have a reserved room in Roskins Hall at University of Nebraska-Omaha for our use all day on Friday, July 1st. I don't have a full description of the room, other than it's "high-tech" and no cost to us. It should be similar to the one Zack got for us last year. I'll get more info on whether it's wired or wireless Internet access, and the details on the projectors.

A campus map is at http://www.unomaha.edu/pages/map.html . The visitor parking that's mentioned on the page is not suitable for an all-day event like this. Parking passes are a possibility, and if that fails the parking garage at the southeast edge of campus has plenty of room and only costs 50 cents or $1 in quarters. Lower your antennas, though.

For hotels, I would suggest searching for hotels near 6001 Dodge Street in Omaha. There is a Residence Inn about 3/4 mile west of the campus that is pretty nice, but more expensive (discount for weekend days, though). There are 5 or 6 hotels of varying quality and price near the 72nd St exit off I-80. The 72nd St/I-80 is also halfway between the two launch sites I have picked out. One hotel near UNO I checked on is already sold out for Thursday night, but the others appear to be open so far. If you're bringing a spouse who will be exploring the downtown area on foot (Old Market, etc.) while you're doing balloon stuff, there are several hotels there as well.

Thanks to those who have already provided their frequency/payload listings.

UNO makes it easy to compare alternatives:

Go to http://www.unomaha.edu/

From the list far left select VISIT UNO

Under LODGING select links to lodging choices

A quick scan finds:

Holiday Inn $75/night (Big convention facility)

Hampton Inn $89 (Free breakfast)

Comfort Inn $86 (Free breakfast)

Econo Lodge $50

All are within reasonable driving distance but I don't have a clue about driving conditions. Econo Lodge is the closest (2mi west on Dodge St).

Should we select an alternative so that most of us are staying in the same place? If so, suggest which place.

With no coordination I will probably stay at the Comfort Inn.

72nd and Dodge is one of the busiest intersections in the city and making left turns through it can be time-consuming. However, this will be a problem mostly on Friday afternoon after the conference - the other times you'll be going straight through or turning right.

Obviously since I live here I have little experience with the hotels. There is one at the 72nd/I-80 interchange which I would not recommend, but not sure of the name (it's changed probably three times in as many years). I'll post once I drive past there and can see the name. It's not one of the ones Ralph listed - those are OK as far as I know.

The Econo Lodge is near Methodist and Children's Hospital and right next to a Village Inn. The others I believe will require a short drive to a restaurant.

From: n9xtn@cox.net
Topic: 1216 Message: 1216

I got my hosting/domain renewal notice for nstar.org on Monday, but they took the site off-line yesterday before I could get it renewed. The site is back (files are still there), but it may take another day or two before the host re-registers the domain (required manual intervention).

superlaunch.org points to a page on nstar.org, so that's why both are unavailable.

There appeared to be a bad DNS update that went out for www.nstar.org. Cox's nameserves cached a bad DNS lookup to 198.65.102.86 (here at work I have that too). However, if you use the site www.dnsstuff.com and do a lookup on www.nstar.org, you get 213.232.89.202 which appears to be the correct IP.

http://nstar.org did not have this problem.

Those of you using NiChrome for cutdown devices, what are you guys using as heat shields and insulation?

My experience is that the blue/pink Styrofoam will ignite under the right conditions (unlikely but possible). I've tried epoxy to keep it from burning through, but enough heat will melt the epoxy away.

for most of my cutdowns I rig the flight string, then
the cutter nichrome, then I give it a wrap with silica
cloth tape. Then I use a normal desk stapler to keep
it in place. Very lightweight, and very heat/flame
proof, too.
I've often run commanded and timed 'watchdog'
timers, and having a 'watchdog' go off on the ground
in the most often bone dry Colorado area has always
been a concern.

I haven't used it yet, but a natural choice would be a short length of phenolic tubing. If you wanted to get fancy, you could even machine out an enclosure from rod stock. The phenolic will ablate but won't sustain a flame.

EPDM rubber would be another good choice with ablative properties.

Hi Zack,

We mitigate the risk of fire by hitting the burner for just 10 seconds after receipt of a valid cutdown command. It takes jut 2 - 4 sec to effectively melt the nylon lift line, but there must be some tension on it to achieve sepataration. Once or twice, the line has melted w/o tension,
and it came back simply welded back together.

We wrap the burner in some refractory ceramic insulation fabric to about 1/4" thickness and then enclose the whole shebang in a 1/2" thick styrofoam clamshell covered with Al foil duct tape. I keep the 2" of burner feed wires closest the the burner inside the clamshell to avoid cooling to the slipstream. The clamshell is then closed with several wraps of common PVC electrical tape and secured to an anti-rotation yoke attached to the 'chute apex.

The inside surface of the styrofoam does melt back a bit, but it's never ignited.

Hi Zack,

In the flight we recently did at UAH with a wireless nichrome cutter (I used a 315 MHz link between the cutter and the payload)....the nichrome wire was mounted on a PC board along with the 315 MHz receive board and was spaced away from the styrofoam by an inch or more....also, I had it rigged so that it would only activate the nichrome wire only as long as I held a single touchtone on during my command uplink...(after sending an ARM command sequence that latched the arm relay...the CUTDOWN relay was setup as a momentary relay). The touchtone control board activated the 315 MHz transmitter in the main payload. It took about 8 seconds to burn through the paracord we used.

Hi to the eoss trackers/launch team. Here is the hotel data that Larry noble wanted me to post. I have found many hotels at 72 street, also L street, just south of I-80, and several on 680, west of the college on Dodge and other streets. 72nd street has several, The Travel Lodge (55 a night), Holiday inn central (75 a night), and the Super 8 Ak-sar-ben, (75 a nite)all on or near 72nd stree. This is north of I 80 and south of Dodge. The college is at Dodge and 6oth street. Dodge is an east west road and the number streets are north south. Down further to the west, at the junction of I-80 and I-680 is L street. This is south of i_80 and it has mutltiple hotels, too numerous to mention, all between 65 and 90 a nite. The comfort inn, 83 a nite, Econolodge at 56 a nite, and the super 8 southwest at 75.00 a nite. I found these by going to Yahoo and clicking on travel, and putting in the dates, June 30 thru the 3, and then entering Omaha, NE and they all popped up. I am leaning on the L street hotels becuase they have more places nearby to eat at, and aren't that far from the college, 5 to 8 miles. We can drive up on 72nd street to Dodge and then head east to the campus. The hohtels are all new style in that you enter from the hall way, not the front of each room like the old holiday inns. Last year I tried to find a commnly acceptable hotel and wasnt able to get everyone to agree on the same one, so this year here are the choices and everyone can decide on their own. Benjie. W0CBH

Topic: 1230 Message: 1230

Hello GPSL Folks,

It seems that the prevailing GPSL question is "At what hotel is everyone hanging at?" So Benjie, W0CBH and Marty, WA0GEH did a short study and decided to put a stake in the ground.

The Edge of Space Sciences (EOSS) folks will be staying at the Holiday Inn at 72nd and I-80. This facility has a large convention center, indoor Holidome for swapping stories, group gabs, and lies. High speed wireless access in all rooms. Plenty of (great) food around the area and a short distance to the campus (about 3 easy miles north on 72nd street, east on Dodge street to the campus).

We have arranged for a block of 20 rooms for $79.00 Single King Bed, $89.00 Double Beds. If we need more rooms, I will try to get the block expanded if rooms are available.
To register, call 1-402-393-3950 (see below) and mention "Great Plains Super Launch" or "GPSL" to acquire a room from the block and the GPSL rates. Make your reservations soon as this seems like a busy time. As a note, however, neither Benjie or I are managing the reservations, please call the hotel.

Mark, if you feel it is appropriate, you might mention this on the GPSL web site for those who are undecided or want to hang with the group. Thanks.

Thanks Zack,

The Holiday Inn is now requiring a contract for the before-stated rates
that I am not going to sign. That deal is off. Big business!

Therefore, I will probably find my way to the Econo Lodge also.

1238. GPSL Hotel Update

Yahoo group: GPSL (2002 — 2008)
Date: 2005-05-21 02:38:54 UTC
From: Marty Griffin
Topic: 1238 Message: 1238

Hi Folks,
Hope this is not too much of an inconvenience, but the Holiday Inn wanted a contract and all I wanted to do was provide a favor. So no contract. I will probably go to the Econo Lodge. Sorry if this caused any inconvenience.
- Marty

Subject: Re: [GPSL] Hotel Info for Project: Traveler

Hey Marty,

Are you gonna advise the rest of the EOSS contingent to follow suit?
If so, any special group deals at the EconoLodge?

1239. GPA Sky Diamond 7 solar Montgolfier record entries

Yahoo group: GPSL (2002 — 2008)
Date: 2005-05-22 10:22:40 UTC
From: Ralph Wallio, W0RPK
Topic: 1239 Message: 1239

GPA Sky Diamond 7 flight of 21May05 (KC8UCH-11) is in our record books as follows:

Longest Great Circle Distance, Release to Touchdown:
429.28mi 7th place
Robert's solar flights currently hold 4th and 7th-9th of top 10 positions

Longest Mission In Time, Release to Touchdown:
16h16m 2nd place
Robert's solar flights currently hold 2nd, 4th and 5th of top 10 positions

These record entries do not qualify for 2005 contests because SD-7 was not announced 24hrs before launch.

See http://users.crosspaths.net/wallio/RECORDS.htm for all current Amateur Radio High Altitude Ballooning flight records.

1240. Call for updates on speakers and group participation

Yahoo group: GPSL (2002 — 2008)
Date: 2005-05-26 13:20:33 UTC
From: Mark Conner
Topic: 1240 Message: 1240
Attachments: 1 described; binary payloads are missing from this source WARC

Everyone,

Please check www.superlaunch.org <http://www.superlaunch.org/> for your group's status on flying a balloon at GPSL. If it's not correct (you're definitely coming and not tentative, or are definitely not flying, or not on the list and should be) let me know by e-mail. Those groups planning to attend but not flying their own balloons do not have to send me anything - there is no formal registration to attend the conference.

If you are planning to fly, even tentatively, send in a frequency coordination worksheet (attached). If you have not sent me one for your group, please do so within the next week. We need to get time slots assigned soon so that people who have to program their payloads can do so - otherwise, you'll have to find your own unoccupied downlink frequency. For APRS, we'll concentrate on 144.34 MHz, with 144.36 as an alternate. 144.39 will be used mainly for low-rate backups and the like.

I'm on the road this week, so I don't have my list of who has and has not turned in worksheets. If in doubt, send it again - electrons are cheap.

If you have a formal presentation you'd like to give, let me know. We do plan to have the opportunity for "what we did last summer" talks from any group that wishes to do so. I have two topics from W0RPK and one from KD4STH.

After I get back to Omaha next week, I plan to start putting together the frequency coordination and the agenda. June is going to be a busy month between work, family, and GPSL prep - please help by getting your information in early.

This should be a really big event. I just hope that the weather doesn't force us to cancel flying completely. It would be unusual, but not impossible, to have two consecutive days of unflyable weather in early July.

From: Mark Conner
Topic: 1241 Message: 1241

WB8ELK and I will have spare balloons available at the launch site should someone need one. The "launch day markup" won't be too exorbitant.. :-).

I have not yet checked to see if we can get a discount for helium. I've been told some lucky people can get it for $35 per T-tank.

From the MECSAT group.
This is our first multiple balloon flight and so far, we've only used APRS for tracking. Could you explain how frequency coordination is done? I was planning on using 144.34 as primary and 144.39 as secondary. Should we plan instead on 144.36? Also is anyone doing ATV? We'd like to try this there - on 439.25Mhz. Is this realistic? We pretty new to ATV.

MECSAT again:
What balloons do you have and what vendor are you
using? We want to fly 1500g balloons and if you
have some on hand and the cost is low, we may
just get them from you. We have used Kaysam which
is now out of business and I'm not sure the
quality was that great. Our last flight, we used
Scientific Sales which is a little pricey and for
local launches, I think we'll go with Kaymont
next time. Also, we definitely want in on the
group helium buy and will wait for the details.

Hi:

Combining ATV with balloon flights is very interesting.
I am ready to launch my first high altitude balloon and
microsatellite fully equipped with ATV and APRS.

I have several pictures of the micro-satellite COQUI-1.
If administrator of this group authorize me to post the pictures i
will send later ok.

Greetings from Puerto Rico & good luck..!

Feel free to visit and register here:

1245. Balloons and Telescope

Yahoo group: GPSL (2002 — 2008)
Date: 2005-05-31 14:52:13 UTC
From: PAUL VERHAGE
Topic: 1245 Message: 1245

At Fire in the Sky, a high power rocket launch, amateur astronomers set up telescope for public use. During the day, I had them turn a couple of telescopes to the balloon we launched. At 87,000 feet we could see the balloon and payload clearly at 48 power.

The payload string was swingly until 80,000 feet, when it hung still. At balloon burst, the latex and talcum power formed a disk of stars above the parachute. The astronomers were able to follow the parachute all the way down. It was amazing!

We ought to see if we can get the Ohama Astronomical Society to do a visual track on the balloons we're launching. I'd like to see them get some photos. Mark, will you have time to do this? I was a member of the club when I was stationed at SAC. I can contact them if you're already busy enough.

Paul

1246. W0RPK staying at EconoLodge & CubeSat meeting

Yahoo group: GPSL (2002 — 2008)
Date: 2005-05-31 16:11:45 UTC
From: Ralph Wallio, W0RPK
Topic: 1246 Message: 1246

If anybody dares to care, I have reservations at the same EconoLodge Zach and Jon will be staying at. My alleged plan is to arrive in time for lunch on Thursday and then will be meeting informally with CubeSat teams from the University of Kansas, Taylor University and (possibly) Iowa State University. This gathering will be held in the EconoLodge meeting room.

Anyone is welcome to join us. See
http://cubesat.calpoly.edu/_new/index.html and
http://www.engr.ku.edu/ae/kutesat.htm and
http://www.css.tayloru.edu/~physics/picosat/ and
http://cosmos.ssol.iastate.edu/cysat/ for more info about CubeSats.

I will then be available for an informal evening meal somewhere with someone.

I got the data set for this flight this morning, so I haven't had time
to look at them. The winds did get light with altitude, but as I
recall, they were light much lower than 80,000 feet.

I'll gen the charts tonight and pass the results along.

From: Rochte, Robert
Topic: 1250 Message: 1251

Bob Bruninga has recently recommended alternating paths of WIDE and WIDE2-2. The WIDE is still used in case the digis in your flight area haven't yet switched to the new WIDEn-n paradigm. RELAY and WIDE1-1 shouldn't be used at altitude at all.

These alternating paths worked fine on my recent SD7 flight - the only problems were caused by flying over Ohio on the same day as Hamvention (the network was just a *little* congested that day!)....

>There was a balloon flight over Hamvention on that weekend? Wow, did I
>miss the announcements?
>

Yes, the flight started north of Detroit, spent most of the day over
south-central Ohio and landed just north of the North Carolina border near
Stuart, VA, around midnight. The announcement didn't go out until that
morning, so few people looked for it.

I had this bright idea that we'd give all of the APRS users at Hamvention
something to see - without considering just how clogged the network would be
that day! The result was that very few packets were Igated once the balloon
was over central Ohio (the bulk of the flight)...

The track is still viewable on APRSworld.net - callsign used was KC8UCH-11.

73,
Robert

Much of the central/western Iowa area is migrating away from the use of RELAY and WIDE. Eastern Nebraska still uses both, but is also capable of WIDEN-n.

My recommendation for any 144.39 balloon beacons is to use WIDE2-1. This will give you one hop through any of the WIDEN-n digipeaters in the area. I think running WIDE2-2 with an airborne beacon would cause a lot of QRM (two hops), especially since many of us will be running backup beacons on 144.39.

Besides, it is unlikely we'll be landing close enough to a RELAY-only station to be of any use for final location tracking.

seems odd. from that altitude, your package should have gotten into igates in adjacent states. The pocket tracker + twin lead jpole that I flew on an EOSS flight launched from Windsor (60 miles north of Denver) last year got i-gated ok but curiously it was not i-gated at all from any Denver area i-gates. (EOSS is normally pretty averse to putting anything on 144.39, they often have 4-5 i-gates QSY to different frequencies, maybe no-one was listening/gating on 144.39 then) All but one of the i-gates that gated my payload were out of state. The one i-gate in Colorado was in Monument, just south of the palmer divide, a high region that seals off Denver from the south of the state. And to get into the Monument i-gate, it was a trick shot from the Walsenburg digipeater about 200 miles south of the balloon, then back north to the i-gate, about 80 miles north of the digi. For the record, this was flown with the old-school 'WIDE', in the future I'll probably opt for WIDE2-1 or even WIDE2-2. For those of you who haven't kept up, 'new paradigm paths' are underfoot. If I understand correctly WIDE1-1 is the same as RELAY used to be and WIDE2-1 is not the same thing as WIDE1-1.

Anywhooo, airborne paths discussion attracts plenty of opinions and a lesser amount of knowledge. I've had plenty of hams tell me that beaconning on 144.39 either won't work or is just so darn impactful that it is inconsiderate to do so. My experience is that it does work, it can work well, and I've *never* gotten complaints from anyone who actually recieved the signal, but I have recieved some 'hate mail' from people theorizing about how overloaded their metro area aprs network would be when my rock crushing 200mW beacon sends out once a minute position reports on 144.39 from 300 miles away. Counter to the above position, I get as much 'fan mail' from hams that say "high altitude balloon flights are amongst the coolest application of APRS. PLEASE beacon on 144.39 so as to

share the event with hams from far off."

I'd be very interested to hear who's using what paths and how well they work and if any area was so clobbered by it that they sent complaints to the balloon-flier.

best regards,

My experience has been identical to what you describe below... The only complaints have been from people on the TAPR mailing list - when I have asked for data that supports the "network congestion" argument, I have received no responses (other than more speculation with lots of questionable math). Nonetheless, I asked for path suggestions on the TAPR list before this most recent flight and the alternating WIDE and WIDE2-2 paths were the consensus opinion.

The reasoning behind the alternating paths (which a TinyTrak does easily and an Opentracker can be tricked into doing) is to cover both old- and new-paradigm digis... My understanding is that the old ones won't respond to WIDEn-n and the new ones won't respond to WIDE.

On the recent SD7 flight, the only packets that were Igated while floating over Ohio went through out-of-state digis (NY and PA). My antenna was less than optimal (a 1/4 wave whip with a wire counterpoise), so I count myself lucky for getting through at all.

I wonder how many digi sites that are most likely in a location that is not easily accessable that are able to change from 144.39 to 144.34 on the fly to accomodate an occasional and very much welcomed APRS test from a balloon. My digi (MRIDGE) is on a 130 ft grain elevator that I must sign in (since homeland security) to visit and they are now closed on Saturday.

So no more impact an occasional balloon can create should be met with a "bite me" and go with 144.39 for those that are interested may appreciate the effort and those that don't can "bite me". and runthe balloon on a channel that the most can enjoy for the moment.

1258. Balloons on 144.39

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-03 19:22:34 UTC
From: n9xtn@cox.net
Topic: 1258 Message: 1258

Since NSTAR has taken to running two beacons, we get the best of both worlds. Our backup beacon (before it left formation prematurely on its last flight) was once a minute on 144.39 with a path of WIDE2-1. The main beacon was on 144.34 and we TX as much as we want to.

Another advantage of using non-144.39 channels is the opportunity to do digipeating via a balloon. We've flown a KPC-3 on 144.34 on several flights and we were able to communicate with distant chase teams by APRS messaging. Having a balloon digi on 144.39 won't work very well because it will hear everything in up to a 400-mi radius.

1261. Univ. of Tennessee balloon launch in ARRL Letter

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-03 23:50:44 UTC
From: Mark Conner
Topic: 1261 Message: 1261

From today's edition of the ARRL Letter:

* University students' first Amateur Radio balloon mission a success:

Members of the University of Tennessee Amateur Radio Club (AA4UT) launched their first balloon carrying Amateur Radio equipment on May 14. The team used APRS to track the balloon--designated UX-1--which had ATV equipment on board to provide a video feed back to Earth. The balloon reached an estimated altitude of approximately 52,000 feet (the GPS units would not read above 32,000 feet) and covered some 90 miles before bursting and descending by parachute. The balloon payload was recovered intact. Mike Coffey, KJ4Z, and Dan Bowen, K2VOL, were the prime movers behind the project. "This is an outstanding effort by young Amateur Radio operators in pursuit of their hobby," commented Tennessee Assistant Section Manager David Bower, K4PZT. Bower says the UT ham club has greatly benefited from the support of local radio amateurs dedicated to promoting Amateur Radio to younger licensees and prospective licensees. "Thanks to these local hams, they have an excellent HF amateur radio station at the University of Tennessee, including a tower and HF beam," Bower said. Another launch in the works for this weekend--June 4--may get media coverage by CNN. There's much more information, videos and photos on the UX-1 Web site <http://sunsite.utk.edu/~mcoffey/ux-1/>.

Date: 2005-06-04 02:28:01 UTC
From: Mike Manes
Topic: 1255 Message: 1262

Folks,

If the balloon beacon is "deaf", e.g. the TinyTrak, then some of its beacons might capture a nearby discriminator over the din of terrestrial beacons heard at altitiude. However, if one is running a full TNC that abides AX.25 carrier sense collision avoidance, it's not likely to "get a beacon in edgewise".

This was EOSS's experience early on, and that's why we avoid 144.39.

Since the FAA is now relying on frequent I-gated position reports in order to avoid mid-airs, this issue has ramifications that go well beyond the enjoyment of the APRS community. Not to mention the importance
of keeping close tabs on payload position in descent in order to recover the student payloads that we carry up on most of our flights.

1263. Frequency coordination forms

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-06 02:56:05 UTC
From: Mark Conner
Topic: 1263 Message: 1263
Attachments: 1 described; binary payloads are missing from this source WARC

I have frequency information for the following groups:

Traveler
MECSAT
KD4STH
ORB
CNNSP

Groups I still need forms for:

EOSS
HABITAT/SkyLab
Project HARPO
WB8ELK
Taylor Univ.

Attached is a form if you need it.

If you plan to fly and are not in either list, let me know. Also, my apologies if you sent me a form and I don't have you listed - I check e-mail on three different computers and I suppose that's asking to get things lost.

I hope to have helium prices and details by early next week. It will be a short turn to get payment in, but I'm hoping for a decent discount so hopefully it will be worth the wait.

Mark we had a planning meeting yesterday. I believe
Steve KA5YFC is handling this, for our group. I'm
afraid he has been out storm spotting (as well as
working special events over the weekend), but should
get it to you soon.

Our next meeting is scheduled for this coming Sunday.
I'm sure he will report back on getting this too you
before then. If not we'll get it to you ASAP.

Launch location was brough up a couple of times, any
update on that?

Please keep us updated on prices, etc.

Thanks,
Don

1265. GPSL repeaters

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-06 13:46:19 UTC
From: n9xtn@cox.net
Topic: 1265 Message: 1265

Some have been asking about repeaters for use at GPSL. I'm working with the owners of 2-3 repeaters (2 on 70cm, 1 on 2m) that should have good coverage for us (HT-accessible at the hotels and UNO). At least one of them will cover us for the drive to either launch site. Once I have secured permission to use them for the period, I'll post the details here and on the GPSL site (www.superlaunch.org).

In case we have severe weather, the local Skywarn repeater for Douglas County is 146.94-. If a Skywarn net is in progress, please don't call in for weather information but certainly report severe weather if you observe it (hail 3/4" or larger, winds >58 mph, funnel clouds or tornado, etc.).

73 de Mark N9XTN

1266. Repeaters/simplex use at GPSL

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-07 16:29:37 UTC
From: n9xtn@cox.net
Topic: 1266 Message: 1266

I have secured permission from two repeater owners for use of their systems during GPSL 2005.

443.775+ is the main repeater I'd encourage everyone to use. This is the W0EQU repeater located on the KPTM 42 tower near Gretna. It has coverage on I-80 from several miles west of Lincoln, through Omaha, and to around mile marker 30 east into Iowa. It should be accessible by HTs at the hotels and at UNO. We have even used it with 5W HTs from Wahoo. I'm not sure of its coverage to Treynor.

145.115- is for those without UHF capability. It's located in an excellent site in Bellevue. It also has wide-area coverage and most likely is HT-accessible in both places.

Both repeaters do get some ARES use, but usually as backup repeaters. GPSL users should defer to any nets on these repeaters. If a situation comes up where either repeater is required full-time for ARES, we'll make other arrangements.

I will also provide information separately on a linked repeater system that covers the Omaha metro and western Iowa. This system would be used only for launch day if we use the Treynor launch site. We have secured permission to use the Treynor High School parking lot for a launch, and are still working on permission to use a site west of Omaha. Given the wind profiles in the summer, I would expect a 70% chance that we'd use Treynor.

I'm also proposing we use UHF simplex (446.500 MHz) at the launch site. This will prevent desense problems during VHF APRS payload checkout and allow group communication. I would encourage at least one person from each launch team to have an HT on this frequency so we can coordinate without running from group to group. Since we're hams, I suppose we should use our radios to talk to each other. I'm hoping to get Omaha-area volunteers to act as comm people for those groups who will be short-handed - it can be tough to have a balloon in one hand and a radio in the other.

This info will be posted to the GPSL site when I get a chance - it's easier for me to draft e-mails than update the site.

73 de Mark N9XTN

1267. Major updates to GPSL web page

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-08 00:39:33 UTC
From: Mark Conner
Topic: 1267 Message: 1267

The www.superlaunch.org web page has been substantially updated. We have received approval to use Treynor HS and Wahoo HS parking lots for our launches, so those sites are confirmed.

Many other details regarding Friday's events have also been added. A speaker list is being finalized and a full agenda should be available in the next few days. We have selected a Chinese buffet for Friday night's meal - the restaurant has a party room that will hold all of us and the food is good and fairly reasonable ($10.95 for all you can eat, and they usually have crab legs too).

On Thursday afternoon (June 30) an informal CubeSat meeting will be held at the EconoLodge near 109th and J in Omaha. Details on that are posted too. Any GPSLers in town that early are welcome to attend.

Thanks to Ralph Wallio W0RPK for working behind the scenes to make a lot of contacts and firming up our schedule. It's saved me a lot of time.

If you would like to see other information posted on the site, please let me know.

Frequency coordination is still being worked on, slowly. It's hard to do much thinking with a nearly-two-year-old running loose. I hope to devote substantial time to it this weekend and have at least a strawman up by Sunday.

From: Mike Manes
Topic: 1269 Message: 1270

Hi MArk,

Well, we have options for one of 3 APRS modules:

1. the crossband is rockbound on 147.555 and runs a continuous carrier.

2. the AEOSS APRS module has a full KPC-3+ digi and can go anywhere 2m,
but can take a time slot on 144.34, if we plan on some EBBE.

3. One of our cutdowns, K0ANI-11, has APRS and DF, and can go on 2m or
70cm anhywhere - but it's just a beacon. If it doesn't go, then
we'll fly a DF/cutter w/o APRS on 145.600 if we also fly the cross
band, else it'll go on 147.555.

I can bring any or all of these out and config on site.

Some good news....we have been given a price of $35 per T tank for our helium. This is about half of list price. Thanks to Roger KC0MWM of CNNSP for making the phone calls for us to get this price.

The Linweld office in Omaha is in the middle of a move to a new building, and I don't want to bother them too much about getting a similar deal on K tanks. For people using just over a T tank (291 cu ft), we can see about shuffling a T bottle around for topping off. If you really really have to have K tanks, let me know by NLT Monday morning.

My plan is to have Linweld deliver the tanks to my house the Thursday or Friday before GPSL and pick up on the following Tuesday. This will probably incur a small charge, which I'll pro-rate out. I'll work that out with Linweld when I call them. On launch day, we'll have a pickup haul about half and a trailer for the other half.

Once I have firm $$ figures, an order form will be posted to the list with the pricing. We'll have everyone pay for the integer number of T tanks they'll need, and we'll handle spares and fractional tanks by cash or check on launch day. The form will ask for an approx. number of cubic feet you plan to use, so we can make the best use of the helium on hand and not open spare tanks if we don't have to.

Right now I have 8 balloons on the list as flying at GPSL:

NSTAR/CNNSP
EOSS
Traveler
HABITAT/SkyLab
WB8ELK
KD4STH
MECSAT
Taylor Univ.

We would prefer a K tank, but can make do with a T. If someone needs a little extra gas, we'll have some for sale.. ;-)

Hi Zack,

I have not yet made assignments - I expect to have that done this weekend. I can just mark you down for 0-9 seconds on 144.34 if you'd like something to program against.

I'm not sure yet we can get everyone's main payload on 144.34. More than likely we'll split main payloads onto 144.34 and 144.36 and give everyone a 15-sec time slot. But just in case we can get it down to 6 payloads, I'll give you a 10-sec slot.

We have 3 tentative 70cm ATV payloads - WB8ELK, EOSS, and HABITAT/SkyLab.

- Mark

We'll take the 00 timeslot on 34 and plan on NOT flying ATV.

Is the 144.39 frequency going to be a free-for-all for backup beacons?

We'll try to arrange once-per-minute slots on .39 as well to minimize collisions between airborne payloads. If you go with something early in the minute on .39 also (say 00-05), I'll schedule the others in subsequent slots.

How much power does your ATV put out? Is your antenna
vertical or horiz.?

We only have 90mw and a 1/2 w dipole vertical. We are
rock bound on 439.25.

http://www.ngpc.state.ne.us/parks/guides/parksearch/getregion.asp?District=5

There are several state parks that are suitable campgrounds for tent or RV camping. The best is Mahoney State Park about halfway between Omaha and Lincoln, but tends to be busy on holiday weekends. Platte River State Park, Louisville State Rec Area, and Two Rivers SP are other area choices.

Best to reserve your camping spot early to guarantee availability.

I think the only two DSB AM ATV freqs we can use w/o QRM are 426.25 and
439.25. With a 12 MHz bandwidth, 434 MHz will QRM both of those.

Cross-polarization might help, however.

Hi Mark,

EOSS will need about 300 cuft for it's balloon, plus 10 or 20 more for pibals. In case things go sour with the fill, a spare balloon will be on hand, and we'd like to have another 300 cuft available to fill it. I assume you can get credit for an uncracked bottle?

With our low power, and normal seperation of balloons,
and being the opposite polarity, I don't think we
should interfer with anyone. ;-)

1295. Anyone from Taylor Univ. on list?

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-11 14:16:35 UTC
From: Mark Conner
Topic: 1295 Message: 1295

Can someone from Taylor Univ. e-mail me at n9xtn@... ASAP regarding the payloads you plan to fly at GPSL? I want to make sure the frequencies and time slots we'll give you are compatible with your payloads.

73 de Mark N9XTN

1296. ATV deconfliction

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-11 19:13:06 UTC
From: Mark Conner
Topic: 1296 Message: 1296

I have five groups wishing to fly ATV at GPSL:

EOSS: Rock-bound on 426.25

HABITAT/SkyLab: Rock-bound on 439.25 (90 mW)

MECSAT: 426.25 or 434.00 or 439.25 (1W)

WB8ELK: 426.25 or 434.00 or 439.25 (1W)

Traveler: Capability unknown

First, has anyone decided not to fly ATV? Second, I'm open to ideas on how to resolve who flies what. I'm not familiar with ATV, so I don't know how much coexistence can be had with cross-polarization and frequency separation.

Time slots to be out shortly.

73 de Mark N9XTN

1298. Time slot and frequency assignments available

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-11 20:06:56 UTC
From: Mark Conner
Topic: 1298 Message: 1298

http://www.superlaunch.org/frequencies.html

Please check your assigments and let me know of any problems. The slotting is provisional, so don't take these as gospel just yet.

Bill WB8ELK - would you like two of your beacons on 144.36? That may help you track two flights simultaneously. Most everyone is flexible between .34 and .36.

I did not put in ATV yet, pending resolution of who will be flying what.

For EOSS (hope your flight(s) went well, BTW) - with the number of slots dwindling and your interest in perhaps using 145.60 and 147.555 with APRS, do you want a time slot on 144.34 or 144.36? You're wide-open on the other frequencies. If you'd like a 144.34/144.36 slot, we'll reduce to 10-sec slots.

Harry KC5TRB - are you flying at GPSL? If not, that will free one of the other slots.

Don KA0JLF - I put you down for 147.585 SSTV - NSTAR has used this before. You can choose another open frequency if you wish.

73 de Mark N9XTN

Thanks Mark, I just got word from our receive station
that will put them on the web real time at
http://www.fmsstv.net He too said we should stay with
that freq.

That is what we have used in the past too, so it is
well known. ;-)

1300. Re: [GPSL] ATV deconfliction

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-11 21:34:19 UTC
From: Don KA0JLF
Topic: 1296 Message: 1300

We don't HAVE to fly ATV either, but we are still hoping to get a successful ATV flight in. In the past something has always happened, power drops out, camera shuts off, something.

Those of you with experience, correct me if I'm wrong, but:

I don't expect much from our ATV except near take off and landing. With our low power, and opposite polarity of antenna, and separation of balloons (probably by a few miles as in the past) I don't think we should cause interference with someone else. Except at launch. So we can go either way, whatever is best for the group.

We are mainly interested in the DVC anyway, so that can fly with or without ATV.

I guess it is possible, for us to turn the xmiter on and off, a pseudo time slot. ;-)

I guess we're in the same boat as KA0JLF. We don't really HAVE to fly ATV either. Our first trial was pretty much what he described - near take off and we were hoping for better results this time around. However, to help with the deconfliction, MECSAT will withdraw and check out what other ATVers are doing at the launch.

1303. low power ATV performance

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-12 02:47:50 UTC
From: wb8elk@aol.com
Topic: 1303 Message: 1303

Don,

We had experience with 100 milliwatts on ATV last Fall....the students didn't tune up the 1 W transmitter and it flew with 0.1 W instead.....we only received video out to about 10 miles away on the way up with a beam at the ground station...the video signal faded at 20,000 feet.. and we only started to receive the video from 3 miles away on landing from the mobile.

With 1W to a Little Wheel on the payload and an M2 square HALO (HO432 LOOP) on the mobile (with ARR preamp and Icom R-3)....I received color throughout the last flight from my mobile (although it was snowy at peak altitude).....we typically see P2 to P3 signal reports out to 300 miles or so at altitude with this setup if the receiving station has a decent antenna and preamp.

1304. Re: [GPSL] Re: ATV deconfliction

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-12 03:00:46 UTC
From: wb8elk@aol.com
Topic: 1296 Message: 1304

If I can resurrect my HATS 1255 MHz FM ATV transmitter I can do that instead....otherwise I can remotely turn mine off and on if there's interference if I run on 434 MHz. I'll do a terrestrial test running multiple transmitters at the same time on 439.25, 434 or 426.25 and see how it works from 20 miles away....there's over a MHz further seperation between 426.25 and 434 MHz than between 434 and 439.25 since the actual cable channel frequencies are 433.25 and 427.25 MHz....so the interference to 426.25 won't be so bad I think....but 434 would probably put interference into a signal on 439.25 although the polarization difference isolation may do the trick here.

NO! (sorry about that) don't give up. It has been my experience (probably all of ours) things have a way of working themselfs out. STuff happens, if all of us are prepared for ATV, then last minute issues won't prevent someone from flying the ATV.

This can be a last minute decision, and I'm willing to accomodate others. So PLEASE let's not shot ourselfs in the foot before we get our shoes on. ;-) What the heck does that mean? ;-) Sorry it just came out of the fingers. Humor intended but may not be there. ;-)

Everyone,

In order to make sure the UNO food court and the China One buffet are prepared to host us for lunch and dinner on Friday, we need to provide firmer attendance numbers than we have at the moment. Below is the latest we have. If your group has changes, or is not listed, please let me know your expected numbers.

Group Lunch/Dinner

CAP-N-SPACE: ?/?
CNNSP: 5/5
EOSS: 13/13
GPA: 2/2
HABITAT: ?/?
MECSAT: ?/?
ORB: ?/?
Traveler: 1/?
Taylor Univ: ?/?
KD4STH: 1/1
WB8ELK: 1/1
Iowa State ?/?
KU ?/?

For NSTAR, let me know if you plan to attend the conference (with lunch) and/or the Friday night dinner.

Traveler will probably be 1/2. My wife may join us for lunch, but I'd say that's a pretty big maybe.

BTW, are there any plans for spousal entertainment on Friday during the symposium?

From: Mark Conner
Topic: 1310 Message: 1313

My wife was hoping to take care of that when NSTAR agreed to host GPSL 2005, but since she'll be 8.5 months pregnant she won't be able to.

For something outdoors, I would suggest the Henry Doorly Zoo (13th St just south of I-80, next to Rosenblatt Stadium). Area malls include Westroads (102nd and Dodge), Oak View (144th and Center) or Village Pointe (168th and Dodge). Westroads and Oak View are conventional indoor malls, Village Pointe is a new "outdoor mall" similar to some of the ones I remember seeing around Broomfield CO.

The Omaha Children's Museum is good for kids ages 2-10.

The Old Market area in downtown Omaha also has a variety of niche stores that are out of the ordinary.

I'd also recommend the Strategic Air and Space Museum between Lincoln and Omaha, but that will appeal more to the GPSL attendees than spouses I imagine. If you do have an extra half-day (or we get rained out Saturday), it's worth the drive.

1318. Max altitude considerations

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-17 13:59:55 UTC
From: n9xtn@cox.net
Topic: 1318 Message: 1318

The GFS data is now covering the GPSL weekend. So far, the predictions indicate sunny and hot weather (90s to 100F). You may wish to factor this into your planning (bring water for the chase and use lots of sunscreen).

Also, the forecasts indicate the winds below 60,000' could be light from the west, while the winds above are from the east and get stronger as you approach 100kft. We could be in a situation where if the balloon burst at 80,000 ft the landing will be several miles east of the launch site, while a burst at 105,000 ft puts you several miles west.

Our current launch sites can't handle both - east of Wahoo are the Platte and Elkhorn rivers with lots of trees, then you get into more developed areas. West of Treynor gets you into Eppley airspace and more development.

Is there anyone planning to exceed the mid-90s with their flight? I think we'll only have a problem if anyone goes higher than that. Also, the forecasts two weeks out are not all that great, so it's far from certain we will have this situation. But it's easier to think about it now than it will be when GPSL starts. We should try to have about the same maximum altitudes to make planning and launch site selection easier.

Hi Mark,

Just got back from a week in Sweden, so apologize for the late response.
And that meant that I missed EOSS-91, which I hear went well, except
for a re-run of that irreproducible GPS error on late descent. Glad we
have
baro telemetry to cover the altitude part, but gotta DF for the
position.

Yeah, EOSS can take a 10-sec or 15-sec slot on 144.34, or we can move
off to 145.600 - or even 70cm.

Since I have dialup, accessing web sites for simple textual info is
a major pain. Could you cut the time slot assignment info over to me
or this reflector as a simple text email?

No, there's no reason to foreclose options at this point, however, we could find ourselves in a situation where some people will fly a 90,000' flight from one launch site and land safely, while those getting to 105,000' would have an unfavorable landing from the same launch point.

So if it's possible, I would suggest that those groups planning to fly high also bring the capability to not go as high.

Today's forecast shows it not to be a problem - we'd fly from Treynor and the landings would be between 25 and 40 miles to the ENE.

Bill, do you want two of your beacons on one frequency, or one on all three like it's assigned now?

Traveler has dropped out for ATV, so it's now 4 groups on three frequencies. MECSAT and WB8ELK are both capable of all three. EOSS is rockbound on 426.25 and HABITAT on 439.25.

One option, to get some physical separation, is to have one of the two balloons flying the same ATV frequency to launch at different times.

From: n9xtn@cox.net
Topic: 1330 Message: 1330

An agenda for Friday is now available at http://www.superlaunch.org . Each talk is set to go about 45 minutes, which will leave 15 minutes for Q&A, break, and offline discussions. Additional maps have been posted as well.

The conference will be held in "Pod C" in Roskens Hall, which I am told seats at least 112. I still have not heard back regarding wired or wireless Internet availability in this room. From reading the UNO web site, I believe that there should be an extensive WiFi network on campus. However, you should also plan to bring whatever is necessary to hook up to wired Ethernet on Friday if you want it.

Because UNO provides food service to the whole campus, we are not allowed to do our own catering such as bringing in coffee and donuts for the morning. UNO's cost for catering coffee and donuts is somewhat excessive in my opinion ($1.25+ for one coffee cup and one donut). However, the prices for breakfast in the student center food court are pretty reasonable and the court opens at 7am. You are welcome to bring your own items with you to the conference. I believe there are vending machines in the building.

If you have not sent in your helium orders, please do so ASAP.

Hi Mark,

EOSS is willing to ease the congestion on 70cm ATV. We'll leave the
despun
ATV on the deck and replace it and the APRS module with the W0WYX
crossband repeater w/ APRS, rockbound on 445.975 up / 147.555 down
contin.
carrier. And we'll fly our CW/cutdown on 145.600.

It appears that there'll be more than enough 70cm ATV for Chris KB0YRZ
to
record.

Note also that each DSB AM ATV signal covers carrier +/- 6 MHz, or 12
MHz.
Since the entire 70cm band is just 30 MHz wide, then there's QRM-free
room for only two ATV sigs: 426.25 and 439.25.

Hi Bill,

Well, it does appear that there will be plenty of 70 cm ATV flying at GPSL 05, so Chris KB0YRZ will have plenty to watch with his mobile ATV & VCR - in that case, then I'm inclined to leave the EOSS de-spun ATV on the deck and replace it with the lighter 445.975/147.555 crossband repeater.

Re 434 MHz: haven't tried it, but suspect that, since DSB AM ATV fills 6 MHz
on either side of the carrier, it will QRM both 426 and 439 ATV sigs.

Looking forward to flying with ya again, Bill!

Ok, since we seem to be a fly in the ointment, we'll
drop the ATV payload.

Why can't we all just follow your advice (KA0JLF) and come prepared
for ATV? When I was going to drop out, you said that we should see
what we can work out when we get there. I'm a rank amateur at ATV and
don't want to stand in the way of you and EOSS.

1336. ATV at GPSL

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-22 15:37:42 UTC
From: n9xtn@cox.net
Topic: 1336 Message: 1336

I would suggest to all the ATV groups that they at least bring their equipment next week. We can do rock/paper/scissors on Friday, or fly them all and see what happens. It may be nice to know if physical separation and relatively low power might mitigate some of the adjacent-channel QRM issues.

1338. Re: [GPSL] Time slot and frequency assignments available

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-22 18:18:37 UTC
From: Harry M
Topic: 1298 Message: 1338

Mark,

I will be flying at GPSL!
I only have VHF for tracking in the Jeep, I can't go UHF.

On time Slotting, I will be using a TTIII and I'm not sure what I need to
put in for the setup.
I had a problem at GPSL2004 trying to put it in and ended up turning it on
at the launch site
when there were no other transmissions.

1340. GPSL 2005 t-shirts

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-23 02:00:55 UTC
From: Mark Conner
Topic: 1340 Message: 1340

Everyone,

I've decided to try this out as a sort of experiment. I only found this site Sunday and decided to create a GPSL 2005 t-shirt with it. It looked good enough and the prices were reasonable enough that I figured I'd offer this to the group for an opportunity to order their own shirts.

Here's the link:

http://www.zazzle.com/products/product/product.asp?caching=on <http://www.zazzle.com/products/product/product.asp?caching=on&product%5Fid=235584381215369991&index=2> &product%5Fid=235584381215369991&index=2

You can customize this shirt with your callsign on the front if you want, or you can leave it as-is if you prefer. You can see what your price will be before committing to an order. Each shirt runs about $17 plus S&H. Obviously, a group order will reduce those shipping charges and brings a quantity discount, but I didn't really have time now to organize a group order for all the participants.

In addition to regular t-shirts, polos, premium T's, and other apparel items are available with the same design. I would recommend a white or light gray item, as the light parts of any image will show the shirt color.

Any proceeds will go towards defraying overhead expenses for the GPSL.

I have no personal experience with this company, other than to find them on the net and decide they were very reasonably priced for small quantities. I plan to make my own order and have the shirts here in time for next Friday. Zazzle indicates they will ship within 24 hrs after order receipt, so if you order this week you should get it in time to have before your departure for Omaha.

You can order this shirt after GPSL if you wish - this design will stay on the site indefinitely.

E-mail me if you have any questions.

Hi Harry,

If you have the windoze-based ttconfig.exe, it's easy to set up slotting
via the serial port.

That program is downloadable from www.byonics.com. Be sure to set
slotting up for both the primary and secondary beacons, tho.

1347. Re: [GPSL] Time slot and frequency assignments available

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-23 17:18:58 UTC
From: Harry M
Topic: 1298 Message: 1347

Hi Mike,

I am familiar with the program just not the slotting portion.
My time slot is listed on the GPSL site as 20-29 on 144.360.
Do I just pick one at random, say 28, or do I get assigned one?

I came through Pueblo, Co Springs, Denver and stayed in
Longmont last weekend for a couple days. I tried to call you
on the 449.350 repeater, but no joy. I would have called,
but I lost your phone number.

73 Harry

Looks like I have to register to CUSTOMIZE!

Below and to the right of the "Great Plains Super Launch" apparel, there are four buttons, one of which is "Customize". This should let you add or delete anything you wish.

From: n9xtn@cox.net
Topic: 1298 Message: 1349

To be safe, pick something in the middle of that range. 23 or 24 would work well, as the TT3 probably won't process and start TXing for a second or two.

As long as your transmissions are within the 20-29 seconds after the minute, that's all that's necessary.

Subject: [GPSL] Updates for GPSL attendance

Everyone,

In order to make sure the UNO food court and the China One buffet are prepared to host us for lunch and dinner on Friday, we need to provide firmer attendance numbers than we have at the moment. Below is the latest we have. If your group has changes, or is not listed, please let me know your expected numbers.

Group Lunch/Dinner

CAP-N-SPACE: ?/?
CNNSP: 5/5
EOSS: 13/13
GPA: 2/2
HABITAT: ?/?
MECSAT: ?/?
ORB: ?/?
Traveler: 1/?
Taylor Univ: ?/?
KD4STH: 1/1
WB8ELK: 1/1
Iowa State ?/?
KU ?/?

For NSTAR, let me know if you plan to attend the conference (with lunch) and/or the Friday night dinner.

1355. 8-day weather forecast for GPSL

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-24 20:24:20 UTC
From: n9xtn@cox.net
Topic: 1355 Message: 1355

The end of next week looks like a fairly typical summertime pattern. The Bermuda high will extend over much of the southeast and south, just far enough to choke off the really good Gulf moisture feed. There should be enough, however, to still make it humid around here.

A low in eastern Colorado may cause us some trouble with winds. I expect the morning inversion will keep things quiet early, but anything past 9am will risk 15-kt winds out of the south. Our launch sites are pretty open, so there won't be much shelter.

A few afternoon thunderstorms are possible, but it doesn't look like anything organized will threaten us in the morning.

Morning temps should be around 70 and afternoon highs in the low 90s.

The upper-level winds are generally from the west at 15-40 knots up through 65,000 ft. Above that, they will switch to the east at 15-25 knots. I believe that should put our landings east of the launch site, meaning we'll most likely use Treynor HS in Iowa.

Pending a few inputs from people, I have some placements worked out for the groups at the parking lots. In general, we'll put the helium tanks on the edge of the parking lot and people can choose to fill on the grass or on the concrete. We'll try to keep vehicles away from where people are filling. Both parking lots have some light poles, but are mostly free of overhead power lines. You may have to move a little after filling if you're directly upwind of a pole.

Zack W0ZC is bringing an airband radio, so we will make an announcement on the appropriate CTAF/UNICOM (122.7 for Wahoo, 122.8 for Council Bluffs) prior to release.

It's been emphasized in previous years, and we'll do so again - PLEASE arrive early enough to launch on time! I expect to have the helium on-site by 0630, and suggest everyone get to the launch site around 0700. We'll start filling balloons around 0800 for a launch at 0830.

I should phrase that as "unnecessary vehicles". If you want a vehicle close to where you fill, and it doesn't block someone else, that's fine. I just want to avoid having a vehicle that's not within that group's control blocking their fill/launch position.

Probably not easily, unless someone in the group has one they can bring. I would like to get one person from each group on an HT on 446.50 MHz for launch day so we can communicate without yelling. With all the 2m payloads I think we'll have a hard time communicating on 2m simplex at the launch site.

Gee, a bunch of ham radio folks communicating by radio...who'da thunk it.....

From: Mike Manes
Topic: 1298 Message: 1364

Hi Bill,

The EOSS ATV is controlled by a Basic Stamp 1, generating MCS ID on
the audio side and switching cameras between the despun look-down and
the up-look at about 50K ft.

THe BSC1 timing is a bit coarse, but perhaps I could rig up that 50/50
2-min cycle, unless some other disaster, like windoze media player
wiping
out my digital camera driver, crops up between now and then!

1366. GPSL forecast, 25 Jun

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-25 20:58:06 UTC
From: Mark Conner
Topic: 1366 Message: 1366

The forecast for next weekend is looking a little better. A weak frontal boundary will push south through the area late Thursday and could provide some lingering showers Friday morning, then clearing skies. Saturday morning looks to be partly cloudy with light winds from the south. A slight chance of showers is possible in the afternoon. Temperatures both days should range from the upper 60s in the morning to the mid-upper 80s in the afternoon, which is quite pleasant for Nebraska on 4th of July weekend (it's been in the mid-90s the past several days).

In general, the winds should be strong enough from the west between 15,000 and 50,000 ft to put all our landing east of the launch site, meaning we can comfortably use Treynor IA. Using the 12Z GFS winds from this morning's run, a 105kft burst would land about 5 miles SSE of Atlantic, IA. An 85,000 ft burst would be farther east, about 5 miles north of Massena. This is a pretty favorable area, with a good road grid, few trees, and just widely-spaced farmhouses.

Hi,

The subject plan(s) are attached as a Word97 .doc file.

Assuming that WB8ELK and EOSS can TDM 426.25 MHz at 60s / 60s intervals,
then our primary plan goes, else we do the secondary. I'll bring out
both options.

Hi Bill,

Don't have GPS in the ATV module, but I can power up mine on cue from you, and it'll start the BSC1 timing loop (+/- 1 sec) about 2 sec later. I can truncate my QRV time to under 60 sec, if that'll avoid some QRM, but agree that a little won't hurt.

Blasted AOL and their bandwidth-hoggin' proprietary html fonts!!
Gotta cut & paste to make ur email echo ..

Bill Brown wrote"

Hi Mike,

I currently have my ATV payload set for transmitting on ODD minutes and OFF on EVEN minutes.....if you can set yours up for EVEN minutes we can share 426.25...I'm keying off the GPS timestamp. It doesn't matter if the Basic Stamp is off some...we'll just have a bit of overlap is all.

Subject: [GPSL] Time slot adjustment

Mark/Don: Nick and I are working on the KA0JLF-12 HABITAT/Skylab package. Would it be possible to move this one to the 10-19 second slot on .36? That would permit both of the 2-meter KA0JLF APRS systems (which may be on different balloons) to be tracked easier.

Will there be acess to AC at the launch site? We have a Portable Ground Station that we would like plug into AC. I am not sure the amperage needed, but it will run three computers, monitors and two 1 W radios.

Thanks,

Will Holmes

To: GPSL@yahoogroups.com
Subject: [GPSL] Launch site layouts

Attached is a notional launch site layout for Wahoo and Treynor. I've provided about 25 meters of spacing between groups. I did not place the Grosse Point Academy tetroon because I'm not familiar with his needs for space.

At Treynor, you can just see the fences around the ball diamonds. There is a larger open area south of where WB8ELK and HABITAT are stationed.

At Wahoo, the fence around the football field/running track comes relatively close to the parking lot on the northeast side. It is open around the south end of the track back to the west. There are some relatively small trees south of WB8ELK's position, and the parking lot light posts (4-5) are along the edges of the parking lot.

On some pictures I took at Treynor in 2001, there is an above-ground fuel tank near the WB8ELK/HABITAT positions that is not in the satellite image. So there may be a few adjustments that morning.

I'll have signs to mark everyone's launch position, so just look for those on arrival.

From: Holmes, Will
Topic: 1384 Message: 1389

Doug,

Thanks for offering to help us out with this.

Everyone,

We will bring a portable ground station with 3 or four computers and some radios to track the balloons from the launch site. We put this trailer together in the past year, and now we can't think of doing a launch without it. One of the things we would like to do is track all the balloons from the launch site, however we do not have enough radio equipment to do this. We would like to borrow a radio and TNC so that we can receive the beacons from balloons. Our trailer currently has one radio and TNC in it, but we are using these to track our experiment on 146.54. We will have a dedicated computer and monitor for tracking the balloons.

Thanks,

Will Holmes

1390. Taylor Payloads

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-28 16:03:52 UTC
From: Holmes, Will
Topic: 1390 Message: 1390

After reading EOSS's payload plan I thought I would put up a quick summary of our experiments.

Command POD

900 MHZ Radio with downlink of GPS Tracking and Telemetry Data. This data includes temperature, pressure, altitude and vertical rate. The command pod also as the ability to read analog and digital voltages from the other pods in the BalloonSat string.

TUSAT1 POD

This box will contain a test of the amateur radio system for TUSAT1, our CubeSat that is under development. It contains a Kenwood TH-D7 radio with integrated TNC and a Texas Instruments MSP430 microcontroller. We will test our ability to receive the beacon coming from the balloon and our ability to execute commands through this interface. Part of the test will be changing wiper positions on digital pots. Successful execution of this command will be read by an analog voltage feed to the command pod and fed live to the portable ground station.

Tiny Track

This will be our first flight for the Tiny track module. It will be in the 30 - 39 second slot on 144.39.

VLF Receiver

This experiment will include a VLF receiver. The audio from this will be recorded on a commercial off the shelf digital 8 video camera. This camera will also give us a video of the flight.

Hi,

The subject plan(s) are attached as a Word97 .doc file.

Assuming that WB8ELK and EOSS can TDM 426.25 MHz at 60s / 60s intervals, then our primary plan goes, else we do the secondary. I'll bring out both options.

Subject: Re: [GPSL] Launch site AC Power

Why in my day, we had to rub a cat with a wool blanket to get electricity on site. You people have it easy!

Paul

>>> ka0o@... 06/28/05 8:32 AM >>>
For those of you attending the launch, there will be a 5600 watt generator on site Saturday. This will provide power for the portable ground site that
Taylor Univ is bringing. Anyone else needing power that day is welcome to tap into it.

Topic: 1391 Message: 1396

Hi Mark,

Could you site EOSS and WB8ELK adjacent? We have to coordinate ATV
power
up for our TDM scheme on 426.25 MHz, and acoustic comms may be the
simplest
scheme. BTW, if Bill and I can sync up clean, EOSS's primary payload
plan is a go.

Also, if southery sfc winds develop, any way we could fill & launch from
the lee of the HS bldg? Planning all 10 balloons ready to fly
simultaneously at 0830 is an open invite to Murphy - would be nice to
have a sheltered "parking spot" for full balloons awaiting the 'LAUNCH'
command.

BTW, how's the XYL and harmonic doing?

73 de Mike W5VSI

n9xtn@... wrote:
>
> It's too bad we aren't flying Friday morning, as I believe conditions will be ideal then with calm conditions and partly cloudy skies. On Saturday the surface winds will be from the south at 5-8 mph initially, increasing to 10-15 mph as the morning progresses. Again, we should strive to get the balloons off the ground as close to 8:30am as possible. I'm 90% sure we'll be using Treynor.
>
> Sunday will be worse for winds, so that's not an option.
>
> Morning temps on both days should be in the mid 60s. Friday's high will be in the mid 80s and Saturday's high about 90.
>
> The forecast landings remain in a favorable area. Using a nominal 1000 ft/min for ascent and sea-level descent rates, an 85,000 ft burst will land about 7 miles east of Grant, IA. Balloons going to 105 kft will land farther west near Grant itself (a small town about five blocks square). Most of this area is pretty open, with trees mostly confined to the banks the creeks and small rivers in the area.
>
> Attached are some pictures of the Treynor launch site. The satellite photo shows the positions I have for everyone. The other four are frame captures from a video we took on a 2001 flight that was launched from near where the "CAP" label is on the satellite photo. CAP003 and CAP004 are looking south. CAP005 looks east towards the corner where Taylor Univ and EOSS will be located. CAP006 looks more northeast and shows that an addition to the school was added to the east side that's not shown in the satellite photo. I believe there are no power lines between the poles in the parking lot or the ball diamonds.
>

> Depending on where the school buses are parked, we might have to do a little shuffling Saturday morning.
>
> Park any "extra" vehicles in the yellow areas on the map if possible, so that if we have to use the parking lot itself to launch the balloons, we can.

Are surface winds pretty much inevitable? If so, then the solar tetroon probably won't fly - I need calm conditions or it's a no-go (without helium, anyway, and that really spoils the fun).

1399. Western Iowa in the summer

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-29 14:08:36 UTC
From: n9xtn@cox.net
Topic: 1399 Message: 1399

For those of you coming from well outside of the area, here are a couple of things to consider for your packing, dress, and driving on Saturday:

1) Much of the target area is in corn, which in general is about six feet high right now. Most of the roads are on a one-mile grid, so your payload could be a half-mile into the corn (as the crow flies). However, the corn is usually planted in rows across the terrain's fall line to prevent erosion (i.e., not on a grid). This can make plotting the path of least resistance to your payload difficult. Make sure you have a handheld GPS with you and punch in the coordinates of the payload before you set off. Also bring an HT for your hike. You'll probably get a bit dirty walking through the corn too, so it may be useful to bring an old long-sleeve shirt along (keeps the corn leaves from irritating you also).

a) There are also some areas in soybeans (easy) and cattle pasture (easy if no cows).

2) You may encounter a "minimum maintenance" or "service level B" road between you and your target. The level of maintenance varies, but generally seems to be limited to ensuring no large trees are growing in the roadway. Vehicles with low ground clearance may have problems getting high-centered on deeper ruts, and if it's muddy all-wheel drive may be necessary. Normally it's not necessary to use these roads to get to your payload.

3) Quite a few gravel roads in the area too. Use caution when in convoy and allow plenty of following distance as your visibility to the vehicle in front is obscured. Also, it's good practice for the lead vehicle in the convoy to announce oncoming traffic or sudden stops to those behind.

I wouldn't say "inevitable" 72 hours out, but it's pretty likely we'll have 5-10 mph. If you were to get out there at dawn (5:30ish) you might have calm enough conditions, but then you'd have no sun for heating.

This morning's forecasts are showing 20-25 mph just above the surface (500 ft AGL), but a solid inversion that's not forecast to break until about 10am. Trouble is, Treynor is near the top of a ridge and may actually poke up into that windier layer. On previous NSTAR flights I've seen the flags snapping in a 15-mph breeze while our launch site closer to a valley had calm conditions. Sunday is looking worse than Saturday.

We could try to go very early (sunrise 5:54am, arrive at 6, launch at 7:30) and have a better shot at avoiding more of the wind. We can discuss this more at the weather briefing Friday when we'll have a better handle on what to expect.

1405. Forecast update, 29 June

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-29 22:49:55 UTC
From: Mark Conner
Topic: 1405 Message: 1405

I think our biggest concern for Saturday will be how soon the surface winds pick up after sunrise. By 10-11am, we should have gusts to 25 mph out of the south. The landing forecasts still look pretty reasonable. A 105kft burst should land about 8 miles east of Grant, IA, while a lower burst at 85 kft will land another 8 miles farther east (6 mi S of Bridgewater, IA). This is between 40 and 50 miles away from the launch site, on a bearing of 095. This will probably be on the eastern fringe of the linked repeater system too.

73 de Mark N9XTN

1406. Forecast update

Yahoo group: GPSL (2002 — 2008)
Date: 2005-06-30 19:55:11 UTC
From: Mark Conner
Topic: 109 Message: 1406

Looks to be partly cloudy and dry through Saturday afternoon. Winds Saturday morning will be out of the south at 5-10 mph, increasing to 25 mph by noon. Morning lows should be in the low 60s, Friday's high in the low 80s, and near 90 on Saturday. I'm still a little concerned that the winds could increase sharply Saturday morning, perhaps before we're ready.

There is some variation in the direction from Treynor for the landings, between 90 and 115 degrees but still in the 35-45 mile range. This is east of US 71 and south of Hwy 92. The farthest south I've seen the predictions has been 5-6 miles northwest of Corning.

Should you need to make use of gas stations along the way, there are a couple in Griswold and one on the north side of Massena on 92. Otherwise you won't find much in our landing areas.

I'll be monitoring 145.115- and 443.775+ when I can today.

Mark, dad is having another procedure tomorrow, so
Cris and I wont' be able to make GPSL this year.

There are about 5 or 6 from HABITAT SkyLab that will
be there an launch. Only one balloon at GPSL this
year. Jerome, Nick, Larry and Steve (and his XYL)
should be there and handle the HABITAT SkyLab launch.
You have emailed Jerome. Please give the helium to
them for the flight.

The rest of us that can't make it to GPSL 05 will try
to monitor/track from here.

73 and best of flights to everyone!!!

1410. Friday morning

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-01 10:53:45 UTC
From: Mark Conner
Topic: 1410 Message: 1410

The conference will be held in Roskens Hall, Pod C, which is on the lower level. I have not been to the room myself.

I plan to get to Roskens at 0745 this morning. If possible, I will post orange signs to indicate where to go. I'll also have my HT on 443.775- for talk-in assistance.

Plan to use the parking garage on 60th St just south of Dodge. It is best if you take 72nd St north to Dodge, then go east to 60th and take a right. Going north on 60th will not get you to the campus very easily - the street ends at the south edge of campus and you have to go through a park and such. If there's an attendant at the garage, tell them you are attending the Super Launch conference at the Aviation Institute.

I believe everyone is going home with all their toys, even though there were some challenges. I couldn't stay at the restaurant past 3 due to family obligations, but a big thank you to all that participated.

Could someone from each group post a brief recap of their flight and recovery experience? I think there were a lot of interesting stories to tell. I'll have the NSTAR recap sometime tomorrow.

Wow, what a day. Ten flights launched from the same site within about 30 minutes of each other. We didn't hold for a group launch because of the increasing wind.

What is the status of the NY group? Do you have any website/contact
info for them?

1417. Flight recap of Project: Traveler 2005b

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-03 03:32:57 UTC
From: Zack Clobes
Topic: 1417 Message: 1417

I haven't thoroughly reviewed logs yet, but based on some video that I downloaded to the laptop, our flight was approximately 8 minutes in duration, with a maximum altitude somewhere around 5k feet.

Our cutdown board that I've been working with utilizes a Linx RF transmitter chip to send either a heart-beat or cutdown command every minute from the main capsule. If the cutdown doesn't hear a heart-beat for 10 minutes, or if an actual cutdown signal is received, it will actual the hot wires. On the ground I've had mixed results, but I had it running for an hour at the launch site without problems.

We considered pulling the cutdown from the string, but decided that it appeared to be working, so it flew. The payload was released and appeared normal.

Jon and I were in no particular hurry to leave the school after launch. I was fooling around with the ATV recorder (which I quickly gave up on because I couldn't remember where I stuck my remote), and we had to coordinate simplex frequencies. We finally made it out on the highway headed towards Grant (near the predicted landing spot).

Jon soon calls on the radio reporting a problem with lack of packet data, and I confirm the problem with my tracker. At that point, we assumed that N9XTN's GPS failure message was walking over the top of us, not to mention KD4STH's sporadic packets (nudge, nudge). I reassured my copilot (my wife) that the reason that our altitude showed 1200 feet MSL was that we hadn't received any altitude packets since we lifted off.

We continued down the road about 20 miles (nearly to Grant) while I pondered how we would go about DF'ing our capsule with all of the other traffic on frequency. I asked Jon if he had any ideas, and he instead responded with some idea's on what to he wanted to do to "de F'ing" other capsules on frequency.

By this time I'm starting to put the story together in my head, and we pulled over and start looking at logs. Sure enough, the capsule was already on the ground, and about 15 miles behind us nonetheless. I was really hoping that we had somehow contacted another capsule, and it had ruptured our balloon, but I knew deep down that it was the cutdown that had done it.

We drove almost all of the way back to Treynor, and started picking up packets again. After a 1/5 mile walk out into a corn/soybean field, we found a capsule that had been cleanly cut away from an otherwise perfectly good balloon.

On the bright side, we do know that the cutdown works in the air, without catching the board or box on fire. The 123 Lithium batteries were still uncomfortably hot when we retrieved the payload nearly an hour after being fired, which means that we need to turn the cutters off after 20-30 seconds (it usually only takes about 5 seconds to burn through). We are one of the very few groups to have full motion recorded digital video from lift-off to touch-down. And finally, we'll be taking a couple more high-ranking places on Ralph's records page.

The NY group is alive and well. A last minute rigging modification resulted in our antennas being too close we think. We never heard from our .36 beacon and lost the .39 beacon at 27,000 feet - for a while at least. We hung around the general recovery area hoping that when our payloads landed, the antennas would separate and we would get a ground beacon. We found a near-landing beacon (100 feet from ground) on FindU relayed by a passing car. (I have Internet access via my cell phone.) We were trying to hunt it down in a corn field with some of the NSTAR recovery team. Meanwhile someone else (I don't recall his name) picked up the ground beacon from the road, headed into the corn field and picked it up. Thank you, thank you.

At any rate, we retrieved our data including a CO2 profile. We don't have GPS data but can approximate altitudes with our external temperature data if anyone has both temperature and altitude data that we can see. We also have an object in our pictures that looks like the ISS. Does anyone else have this? No ATV though, our video overlay board failed the night before so I couldn't get my call sign on it.

All in all, it was an interesting experience. We and our students learned quite a bit - both from the conference and our adventures in the field and we do plan to join you all next year in Kansas.

Hi Mark,

Just a short note. We recovered the EOSS payload out east of Grant. It was a pretty nominal flight with a few burps on GPS/APRS. More to follow from Mike. Glad to see our New York friends and other teams were successful.

Thanks to Doug Calkins the landowner for his hospitality. He loaded up and went to the recovery site with us and taught us about thistles. Thanks also to Zelda at the cafe in Grant for serving up a bunch of great meals. And thanks to the EOSS crew for their time to attend and contribute. Hello to Nick, N0LP for supporting us from Wichita.

And on behalf of EOSS, thanks to you and your team for hosting great event. The seminars were terrific and a lot was learned and shared. Great to see everyone again and we are looking forward to next year.

- Marty

Hi Bill,

Just got back home from Omaha a few hours ago.

This came in after I'd already loaded the ATV into Rick N0KKZ's SUV - so figured I could reply in person in Omaha. Glad you get the bug out - we've had big probs with 70cm ATV getting into a local GPS as well. Let me know how you fixed yours!

BTW, you'll be happy to know that Chris KB0YRZ >>finally<< got a great tape of both of our ATV sigs in flight from his mobile rig! We'll have to
arrange for a copy to you!

Really happy to see that our "TDM" scheme worked so well! Hardly any crossover at all!

The EOSS payload landed just 1.2 mi from Rick's prediction, in a pasture about 200 ft from a corn field and another 100 yd from a wooded creek. Randy NQ0R saw it land, and the rest of the EOSS team watched the decent from about 1/2 mi away. The farmer joined us in the short hike to recovery and pointed us to great little cafe in Grant, Zelda's.

What a great event! Kudos to Mark Conner for setting it up. And thanks to YOU for pioneering a new aspect of ham radio that seems to be burgeoning
in popularity, particularly amongst colleges.

1437. Fill tube

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-05 18:48:17 UTC
From: Ryan Butler
Topic: 1437 Message: 1437

So from the photos and from my own brief walking around Saturday morning, it seemed like a lot of groups were using very similar fill tubes but I didn't get a good look at exactly what they were, are they something that was made, or bought? I've seen one design that is simply some schedule 40 pvc that is capped on one end and then has a air fitting screwed into a side, is that the pretty standard way of doing it?

Thanks

Ryan Butler, KB0JQO
rbutler@...

NSTAR's is basically that way. I just drilled a hole for the nipple fitting in the cap and epoxied it in. I used oxygen hose fittings, since that was what was on the regulator.

1439. Re: [GPSL] GPSL APRS LOGS

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-05 22:14:10 UTC
From: PAUL VERHAGE
Topic: 1429 Message: 1439

Please make all the logs available, I flew on two frequencies.

Paul

>>> hhm_74115@... 07/04/05 4:18 PM >>>

If anyone has a log of all the GPSL APRS activity on 144.360,
I would appreciate it if you would send it to me. I have a few
missing beacons in my ORB-18 APRS flight log.

Thanks!

1440. Super Launch Ideas

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-05 22:35:15 UTC
From: PAUL VERHAGE
Topic: 1440 Message: 1440

A few items....

I'm trying to design a logo for the Super Launch. I'll send an idea for everyone's comments.

I'd like to see the Super Launch become a formal organization. I'm thinking we could get sponsorships that way and help pay for helium and balloons.

I'd also like to see more Super Launches. The Fire in the Sky rocket meet has agreed to a balloon launch with their Memorial weekend rocket fest. I'd like to make that the Northwest Super Launch (NWSL). On Field Day I'd like to see a nationwide launch. The FDSL wouldn't be a get-together like NWSL or GPSL. We would just organize our launches and try things like EBBE. Finally, I think there should be a super launch in the southeast. Bill Brown could be the coordinator for something like that. A good day would probably be Labor Day.

Inputs? Ideas?

Overall, I'm very impressed with what GPSL has become. Ten balloon launches. That's a record for anyone.

I'm not getting attachments in email right now. Could someone get a copy of the World Herald article for me? I can pick it up on the 23rd.

Paul

1441. GPSL Idea pt 2.

One other thing. I believe CQ VHF is interested in an article on GPSL each year. If so, we should let the coodinator of GPSL get the first chance to write the article. The magazine pays for their articles and this will help compensate the coordinator.

When you get a chance, check out the Deep Impact results. Pretty cool.

However, ,I do have to say, that we in the ARHAB community have tested this procedure years ago.

Subject: Re: [GPSL] GPSL APRS LOGS

Harry,

Attached is my log. I did switch a couple of times to different APRS frequency to see what else was flying around us. I hope it will be of some value to you. When you get your track plotted we would be very interested in seeing it.

Again, thank you for the opportunity to participate in the launch of your ballon. We learned a lot, but still have a lot to learn.

1447. Re: [GPSL] Fill tube

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-06 05:19:15 UTC
From: Mike Manes
Topic: 1437 Message: 1447

Hi Ryan,

EOSS has several fill tubes, with PVC pipe sized to fit the neck size
the balloon. Reducers down to 1.2 inch NPT-F fit the nozzle on the
rubber hose that goes to the He tank. The tare weight bag ties around
one of the reducers. We use hose clamps to secure the balloon neck to
the pipe during fill.

For 3000 gm balloons, we use a PVC 1 1/2" PVC to 1/2" NPT-F flush
bushing
from Mueller. The bushing is modified with a 0.6"W x 0.050"D groove and
two 3/16" holes for a lift line harness. THe fitting goes inside the
3000 gm neck and is held in place with a hose clamp over the groove.

After fill, the fitting is sealed with a PVC 1/2" NPT plug and flies
with
the balloon.

This is much easier than trying to crimp off the very thick rubber on
the neck of these big balloons.

1448. WB8ELK flight recap

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-06 07:09:44 UTC
From: wb8elk@aol.com
Topic: 1448 Message: 1448

Thanks to Mark and all those who helped to make GPSL 2005 a roaring success....it's going to be hard to top the conference room thrill ride. Launch Day results (photos and story to be posted soon to: http://www.wb8elk.com): With the wind starting to pick up and a problem with one of my APRS trackers, I opted to consolidate the two seperate balloon flight trains and hook them onto one balloon instead. Thanks to Ann K0ANN and Marty WA0GEH of EOSS and others who came to my assistance in filling and launching the balloon. We flew a 2000 gram Kaysam with lots of extra lift in order to give us a clean takeoff in the ever-increasing winds. This resulted in a very fast ascent rate around 1360 ft/min. We stopped a few miles west of Grant to await the landing of our balloon (WB8ELK-12) and noticed that shortly after burst (92,874 feet) that the payload was descending a lot faster than usual and appeared to be heading for a landing almost 7 miles to our west. After backtracking just northwest of Elliott, we received the last packet at about 4900 feet and then nothing but a faint signal that was too weak to decode. As Mark KA9SZX and I headed for the position, a deer ran out and put a big dent in KC0SHZ's fender (not sure of his callsign). I then found a new battery for my Icom R-3 and started to look for the video carrier and was thoroughly suprised to see beautiful video that showed the balloon was still over 20,000 high and parachuting down almost 7 miles to our east!!....believing that our APRS transmitter was sending out bogus positions and had just sent us on a wild goose chase, we scurried back to our original position west of Grant and observed weak video shortly after landing showing what appeared to be corn stalks in front of the video camera lens. After DFing the video carrier, we got close enough to read the position off the TV set and after walking through the cornfield, Paul KD4STH joined us and finally located the payload. However, two payloads were missing!! We finally realized that the bogus packets had been real and our two missing payloads (APRS and the CW beacon) had apparently torn free at balloon burst and done a free-fall....I won't be using cheap Walmart nylon cord again. We returned to the last packet reading 7 miles to our west and after searching yet another cornfield (less than a mile west of the Mecsat landing) we finally found the two missing payloads. Even though they came down without a chute in just under 16 minutes, there wasn't a dent or scratch on them and they were both working just fine....apparently the corn must've cushioned the fall. The time-sharing of the 426.25 MHz ATV signal worked really well with just a few seconds of overlap near the end of the flight. The video signals were received in Kansas, Missouri and as far east as Mt. Vernon, Illinois (approx 391 miles). An excerpt of the signal reports listed on the new ATV page on DXworld.com: Jul02 15:42 I am still seeing wb8elk p1 but going down and nothing through the 144.310 repeater (66-39-206-132.ctcco.com 66.39.206.132) Jul02 15:26 My last post must have been the last xmit or burt while not on the air...now nothing de KA9UVY (162-158.wireless.mvn.net 66.232.162.158) Jul02 15:13 Same here kc0hfl (ip68-103-122-52.ks.ok.cox.net 68.103.122.52) Jul02 15:11 P-1 video of ballon still on 426.250 camera shot switches to up a balloon still intact but the other has dissapeared here de ka9uvy em58ng (162-158.wireless.mvn.net 66.232.162.158) Jul02 15:00 wb8elk burst near 93,000 feet de kd0fw (66-39-206-132.ctcco.com 66.39.206.132) Jul02 14:58 The 2 balloons on 426.250 atv are swapping video every minute both just almost P-1 ka9uvy@... 1449. CPANSPACE recap

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-06 12:12:00 UTC
From: Troy Campbell
Topic: 1449 Message: 1449

Many apologies for not reporting back sooner. Our internet cable service went blooey over the weekend and it wasn't repaired till late yesterday afternoon, causing severe e-mail withdrawal.

We really, really appreciate the job that Mark has done this year. Great Job!

Last year CAPNSPACE attended as observers and students. With everyone's help, we've gotten our program off to a good start.

The www.capnspace.org website will be updated this evening so the results will be available tommorrow morning.

The flight ended at just after 10:00 local with Keith, WAOTJT watching it through binoculars. It took us about 2.5 hours to find it because it landed in a corn field and the corn was pretty tall. DFing was hampered some because it was very hilly in the area.

Finally, with the owner of the farm observing it was recovered 30 miles east of launch site bearing 99 degrees, very near Redwood Ave and 100th street. Maximum altitude was 95,082 ft. I'll post the APRS log from the spacecraft's data recorder this evening. It has pretty much all the traffic on 144.36 till 10:00 local.

All the equipment in the spacecraft worked great. The simplex repeater had contacts from Champaign Ill St Louis and Independence Mo. It was a great tool for us as well. Our ground procedures and equipment need work however.

The recap on the web site will have more detail, but our 3rd flight was very successful.

The conference was great and we've gotten a lot of great information from it and well as new design ideas. I'm really, really looking forward to getting all the presentations, etc as my notes are not that complete. (BTW, I own an ISP and have plenty of bandwidth/disk space for those files if needed.)

Okay, I'm done.

Best to all

Troy Campbell, KC0MIC

I don't have a log of 144.340. However, if you go to:

HYPERLINK "http://findu.eoss.org/"http://findu.eoss.org/

or any of the other findu search pages you can enter a callsign and a time window and the system will return any packets it has stored for that station. You'll need to search for "Raw Data for a Specific Station". The default time window on our page is 96 hours. Set that to something outrageously high like 400 hours and you should get what you need. Be sure to set the 400 hours in both windows, Starting Time and Duration.

Seeing your message reminded me I hadn't downloaded the track for my vehicle. I did that just now and got all the APRS packets back to the trip out to Omaha on June 30.

Zack, are you putting something together?

Paul

>>> atvq@... 07/06/05 7:44 AM >>>
Sounds like everyone had a good time at GPSL this year! Congratulations on the sucess of getting all those balloons up, and down.

I will be hard at work this weekend putting together the Summer issue of Amateur Television Quarterly. Any recaps that you would like to have published, send 'em in. Also, either include pictures as attachments or point me to a web page where I can download pictures (make sure I know what to caption them with).

Thanks & glad everyone had a good. time.

I have an article in this month's Nuts and Volts magazine on BalloonSats. You can find my book at www.parallax.com. Click on the Resources tab, then Customer Applications. At the bottom, under Science, you'll find Near Space. The first four chapters (out of a total of 15) and my articles are there.

Chapter Four will be put there ater I get home.

Paul

I have a sister who teaches grade school in Beatrice, NE.
She and some of her associates have expressed some interest in our
hobby and I'd like to get them some information on balloon sats.
I thought at the conference someone mentioned a book that had been
written on the subject. I would appreciate any information that you
all may have on the subject.

Thanks in advance.

1464. Re: [GPSL] Fill tube

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-07 01:31:27 UTC
From: Zack Clobes
Topic: 1437 Message: 1464

I found a nipple at the hardware store that screws directly into the helium tank, and then I use a hose clamp to attach a few feet of clear plastic tubing. The tubing is plenty ridged enough that we just stick it in the neck of the balloon and wrap the whole thing in duct tape.

When the balloon is filled, we have two people handling the neck of the balloon basically, one to tie, and one to hold onto the balloon. Using a challenge/response/confirmation method (Me: "You have the balloon." Them: "I have the balloon." Me again: "You've got it.") we've never lost a balloon or had a problem.

Once the hose is removed, we pinch off the neck, and feed it through a large brass ring (3" dia?) that can be purchased from Hobby Lobby. The neck is doubled back onto itself and we use a plastic zip tie to do the initial seal because it's quick and easy, but not necessarily air-tight. Then we wrap the whole thing with duct tape.

The load line is then attached to the brass ring using a knot or good quality dog-leash style clip.

We use this for two primary reasons:
1. It's simple. In a pinch, you can even get away without using the brass ring by just putting a slip-knot in the rope and feeding the neck through the loop.

2. It's light-weight and doesn't expose hard plastic to a vehicle's windshield. We recently had a Kansas group's balloon impact a windshield at highway speeds. As I understand it, the payload itself didn't do any damage, but a piece of PVC ?in the neck? put a pretty good crack in the window.

1466. Sky Diamond 9 - solar Montgolfiere

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-07 14:51:39 UTC
From: Rochte, Robert
Topic: 1466 Message: 1466

Sky Diamond 9 is aloft at about 15000 feet and almost straight over the Grosse Pointe Academy in Grosse Pointe Farms, Michigan at this moment. Unfortunately, the tracker is no longer attached to the balloon - it instead decided to attach itself to a tree on the Academy grounds!

I thought that we might actually achieve our first successful 100% solar launch with moderate surface winds, but it was not to be. The envelope made contact with one tree, rolled off the branches quite miraculously, and then the lower three feet or so of the payload line tangled around another branch and snapped. The payload plummeted about ten feet down the tree and hung up on a high branch - and the tetroon then continued its normal ascent.

It's a sad, sad day here at GPA... (The taunting by obnoxious pre-teens in our summer camp programme - "hey mister, your bag of groceries is flying away!" - didn't help my mood at all... Alas, they're not regular students here or I would exact an horrible revenge! ;-))

Landing Prediction Analysis

I have been looking over my landing prediction
using the same data I used in Omaha, just to see
if I made an error. I used 800 fpm for ascent in BT
because that's what I expected after only one other
flight using an 800g balloon. I got approx. 1000 fpm
during the flight. Just changing the ascent rate in
BT would have given me a new prediction of 2.19 miles
from landing instead of 13.36 which is my official
prediction error.

It sure is nice to have sonde data from the local area
to make predictions with, unlike here in Tulsa.

Can each group post a listing here of their final landing coordinates...I'd like to plot them on a map.

My flight and landing site data follows:

Kaysam 2000 gram - 430 cu. ft. inflation - 8 lb flight train.

Launch - 1345:42z
Burst - 92,875 ft at 1454:42z
Avg ascent rate: 1330 ft/min.

Burst coordinates:
41d 10.61m
95d 15.89m

WB8ELK ATV (and simplex repeater) landing site:

41d 09.17m
95d 03.87m

1533z landing - 38 minute descent time from burst (6 ft parachute)
Descent rate at landing: 1187 ft/min - (13.5 mph).

WB8ELK-12 APRS and CW beacon landing site:

41d 10.01m
95d 12.11m

1512z landing - 17 minute descent time from burst (freefall)
Descent rate at landing: 3400 ft/min - (38.6 mph).

1477. Re: [GPSL] ORB Landing Prediction

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-08 12:35:14 UTC
From: Ralph Wallio, W0RPK
Topic: 1470 Message: 1477

We are dealing with four uncertainties:

Winds aloft whether observed (RAOB) or forecast (READY).

Ascent velocity (which we know is not a constant, see chaotic discussion at http://users.crosspaths.net/wallio/ASCENT.html)

Burst altitude (unless balloon is cut away before burst)

Descent velocity (partially mitigated by characterizing parachute performance)

Long term collective prediction performance has average error of ~12mi and does not appear to be improving. We don't know if Rick's or Mark's or Harry's next prediction is going to be off by 2mi or 20mi.

Our current collective best foot forward seems to be gathering observed wind data on the way up and continuously refining landing coordinates which eliminates all uncertainties. ANSR (meaning KD7LMO) does it routinely with real time processing in their payloads. ISU/HABET does it in their SSOL in real time with constantly updated mapping.

However, it doesn't seem make much difference whether power lines are involved 2mi or 20mi from a preflight prediction. The next step is controlled descent with either parafoil (e.g., ISU/HABET RGS http://cosmos.ssol.iastate.edu/RGS/), fixed wing (e.g., High Altitude Glider http://members.shaw.ca/sonde/index.htm) or lifting body (e.g., BLT http://www.qsl.net/w5acm/b20.html).

1479. Re: [GPSL] ORB Landing Prediction

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-08 14:30:21 UTC
From: n9xtn@cox.net
Topic: 1470 Message: 1479

In my experience, the uncertainty that contributes most is the ascent velocity, followed by the burst altitude. #3 would be winds aloft, but generally for the layer above 60,000 ft.

With the majority (>80%) of the predictions I have run, the balloon follows the general shape of the predicted track, if the wind prediction is < 18 hrs old. However, we don't control our ascent rate all that well. NSTAR usually errs on the side of overfilling as a result of some bad experiences with trying to get an ascent rate < 1000 ft/min. Getting a 1300 ft/min ascent rate instead of 1000 ft/min usually leads to about a 10% shortening of the distance to landing.

Effects of errors in burst altitude on the landing position vary, of course, on the winds near burst altitude. In the summer, this may contribute a few miles of error, more in the winter.

We did have a situation for NSTAR 05-C where there was a significant difference in the wind profile observed versus the predicted profile used to generate our landing site estimate. The winds dropped off sharply above 58,000 ft which was not reflected in our forecast profile. This caused us to come down short of the prediction by several miles. The forecast models do not include a lot of detail at and above this altitude.

There is probably some more accuracy to be had, but not much:

1) Generate best forecast wind profile possible (mix of observed and forecast data, esp for winds above 55,000 ft). Running a wind profile in the late afternoon or evening before is best. I haven't seen enough changes between a 6-hr forecast run early on the morning of a launch and a 12 or 18-hr forecast run the night before.

2) Control lift so ascent rate matches that used in prediction. This is far more difficult operationally, esp. for those who fill outside. It's a rare day that we can get a lift reading that's worth the effort before launch, and usually we do it after we tie off the balloon and are committed to that lift value. Measuring lift while hooked up to the fill device introduces its own uncertainties.

a) It would be interesting to create a ballast system and the logic to control it so that you could launch at a lower ascent rate, then dump ballast to obtain an ideal rate. But there are a lot of unknowns and variables in that process too.

In general, our predictions tend to be good enough to support being in sight of the payloads as they land, if the driving distance is reasonable (<60 mi). They also tend to be good enough to know if a medium-sized town (pop. >2500) is in the way of a landing so an alternative launch site or day is chosen. Beyond that will likely require a parachute-control mechanism as Ralph mentioned. This could be used to guide the payloads away from the roads (where power lines tend to be) but not so far as to be a long walk into the corn.

Actually, once each group has a final track available (after sorting through the multitude of logs), please post the filtered data to the list or post a URL where it can be downloaded. It would probably be best if it were *not* parsed, so people can feed it into their favorite APRS program for display.

I agree with all the mentioned points. The problem here is
getting good data from any source to run predictions with.
If you draw a 100 mile circle from the center of Tulsa you'll
see that there are no NWS sonde sites, except for PROFILERS.
This detracts significantly from the accuracy of my predictions,
which can vary a great deal no matter whose data I use. I use
READY data for a half dozen or so locations.

Another variable for me is that 90% of the balloons I fly are not
listed in LiftWin. Ascent rate predictions vary considerably. I
rely mostly on previous flights with a like balloon.

On another note, I hope this doesn't happen, but there are entities
trying to only make the NWS data available to commercial entities.
I spoke with the new manager of the Tulsa NWS, he said this is
a very remote possibility at this time, but all it takes is one individual
and one politician to sneak in legislation. I am a member of the NE
Oklahoma Chapter AMS (NEOCAMS) and will attend a meeting
next week where I will see if there is any more news in refard to the
above mentioned plot.

1486. Re: [GPSL] Fill tube

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-07 04:01:29 UTC
From: Mike Manes
Topic: 1437 Message: 1486

Hi Zack,

We use the PVC nipple only on the 3000 gram bags. The neck rubber is so thick that it's nearly impossible to fold in half. And the nipple weighs just 2 oz - not much added to a 6.6 lb balloon, and not much compared to Pete's payload.

1487. LIFTWIN available balloon types

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-08 19:17:26 UTC
From: Hank
Topic: 1470 Message: 1487

> Another variable for me is that 90% of the balloons I fly are
> not listed in LiftWin. Ascent rate predictions vary considerably.
> I rely mostly on previous flights with a like balloon.

Harry,

Could you please let me know what your latest list of
balloons is?

As I've mentioned before, between finding a similar or
identical (same characteristics, different manufacturer)
balloon that is listed, plus using the LIFTWIN burst height
adjustment feature, it should be possible to get a pretty
good match for most balloons that we might run across.

Hank

1488. the quest for accurate landing predictions

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-08 20:01:00 UTC
From: Hank
Topic: 1470 Message: 1488

> Ascent velocity (which we know is not a constant ...)

Even having a more precise *average* ascent speed would help a lot. The lack of constancy is less critical, and some flights have quite remarkable constancy in ascent.

Of course that's part of the problem: some do, and some don't have those steady ascents that the software presumes.

> Burst altitude (unless balloon is cut away before burst)

This error is a combination of manufacturing tolerances, LIFTWIN not taking into account the *exact* temperature variation with altitude, and perhaps a few other variables such as the individual shape of the balloon as it expands, and mechanical factors such as how hard the balloon gets bounced around on its flight upward.

There is also the launch operator error of not being able to precisely (or at least accurately enough) determine the amount of gas used at fill time (either typically by ground lift force measurement, or by other means).

> Long term collective prediction performance has average
> error of ~12mi and does not appear to be improving.

Given the above considerations (and others not treated here), I wouldn't expect any improvement. We are doing the best that can be done with the input values we have available.

> Our current collective best foot forward seems to be gathering observed wind data on the way up and continuously refining landing coordinates which eliminates all uncertainties.

This may be a matter of semantics, but I don't think *all* uncertainties are eliminated. It may appear so because the results can be so much better.

Hank

EOSS data is available at:

http://www.eoss.org/ansrecap/ar_100/recap92.htm

Look towards the bottom of the page for the DATA section. There are a variety of plain text logs and a comma delimited spread sheet of eoss-092 only.

The file "combined log" contains data from all kinds of places (buffer from the KPC3, findu.com, my logs, a few other logs I've come into possession of that covered 144.360 MHz on that day. It contains ONLY the GPS position information for EOSS-092 but does cover from the last ground based packet prior to launch to the first ground based packet upon landing.

Hi Ralph,

Rick's AM prediction was within 1.2 mi of our actaul landing. He passed
that word verbally at the Econolodge at breakfast rather than emailing
it. See the EOSS-92 recap on our web site.

Rick also runs a refined prediction based on ascent winds on his
computer,
and relays the refined prediction thru the EOSS digi on AE0SS-11 as
his call with a big red X icon. That is, when his ground station gets
good packets on ascent - which it didn't during GPSL 05.

Hi Paul & Zack,

Well done, guys! I was kinda wondering when we'd get to the GPSL 2006
bit!

I hope that EOSS can field yet another sizeable contingent. Looking
forward to learning the proposed dates. I see that 4 Jul 06 is on
a Tuesday -- so suspect that the weekend prior would fit tradition?

Hi Robert,

Condolances, sir! I was disappointed that we couldn't witness a
tetroon launch at Treynor last weekend, but thanks for a great
presentation! I'm getting some serious bugging now from the EOSS
team to give one a try here in Colorado (as if we don't have enough
flights on the docket as is!).

Ralph,

I have tried interpolating between manuf. & sizes with a lot of mixed
results..
I even called Kaysam a while back & they didn't even have records of these
Go figure!

The latest balloon is labeled "Kaysam 'HIGH MODULUS 30KM'" dated (2003).
It weighs out to be 794g. Two flights to 95k & 93k, which works out fairly
close
in LiftWin for a Totex 800, given 2lb free lift, 70 deg, 1k alt & 3 lb
payload. At
least this one is performing according to LW.

What I have more of are labeled "Kaysam SW16" dated (2001). They weigh out
to be
825-850g. I have been getting 1100-1300 fpm when LW says 900 fpm.

Actually, I don't think the weekend of the fourth is going to work for Hutchinson. As I recall, there's a major golf tournament in town that week (don't ask me which one, 'cause I dunno), but I'm sure the hotels have been booked for months.

I was going to recommend the weekend prior to Field Day, whatever that is. We could do it following the tournament, but that's probably getting prety late (read HOT).

Any thoughts?

Zack

1500. CNNSP merged position log/NSTAR recap

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-09 01:28:14 UTC
From: Mark Conner
Topic: 1500 Message: 1500

Here's my attempt to merge the CNNSP packets from about four log sources (incl. FindU). There are a few missing, but not many. The burst occurred between 1438 and 1441 UTC. I'm guessing we lost the 1439 and 1440 packets because of the chaos after burst. The highest reported altitude was 90,811 ft. This was on a Kaymont 1000g "high-performance" balloon with about 8.5 lbs suspended from it.

Also, those of you watching 144.34 got rather frequent updates that the NSTAR payload lost its GPS. What happened was that the power cord for the payload got between the DB9 connectors and popped it loose. This happened about a minute and a half before launch. There is a little evidence from the log that it may have been loose for a brief period before then, too. Anyway, we'll switch to putting screws on this connector (want to keep it a DB9 so other GPS units can be swapped in) and be more careful about routing of the wires.

One programming change to be implemented is to have the payload take pictures at some arbitrary interval even if the GPS fails. We got zero pictures because the failure occurred before launch.

1501. FTP server

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-09 20:03:13 UTC
From: Mark Conner
Topic: 1501 Message: 1501

Thanks to Troy KC0MIC of CAP-N-SPACE, we now have an FTP server for uploading GPSL 2005 materials.

Site: capnspace.org

User: gpslftp

Password: gpslftp

Please make a subdirectory with your group name or callsign under the main directory before uploading your files. You can make any subdirectories under your own directory too if that helps to organize your files.

Anyone having pictures or video clips, regardless of whether you're associated with a balloon group or not, please contribute to our GPSL 2005 proceedings CD/DVD.

Some of you have already sent me a CD - if so, you don't need to upload those pictures.

If you would prefer to send me a CD because you're on dial-up and don't want to spend time uploading a large volume of data, you can send me a CD with your pictures at:

Mark Conner

907 Thurston Ave

Bellevue NE 68123-2452

1502. RE: Solar Tetroon

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-10 05:06:54 UTC
From: Rochte, Robert
Topic: 1502 Message: 1502

[Harry: I've copied this to the GPSL group, etc., since others have asked similar questions and your email is the first to which I am responding. I hope you don't mind!]

Thanks for writing. I'm only at the Academy every few days during the summer, so my email sometimes stacks up a bit. Thanks also for the kind words... Regarding SD9, the payload was recovered today with a little help from a high-tech slingshot!

About building a solar tetroon... You could lift a three pound payload to about 65k feet using one of my standard Sky Diamond designs (what I typically use for school programmes). These are made from 8 or 9 micron high-density polyethylene film (thicker film could be used but the design would need to be scaled up significantly). Such film is typically sold in 9 and 12 foot rolls - buy the 12 foot.

Roll the film down a long hallway and measure out 55.5' (that's no typo - fifty-five and a half feet). Cut the film at this point, and then do the same thing again. That is, you will need two 12' x 55.5' sheets to begin construction.

Now open up the two sheets (the rolls are usually folded down to about 1.5') and seal them together along one of the long sides (I'm tired, so please forgive my less-than-clear writing at the moment). You want to end up with a big sheet that measures 24' x 55.5' (if you can find 24' wide film then you can skip this step).

How to seal them together? You can use tape (just use normal Scotch tape - no need for heavy packing tape ala the boys in France) or you can heat seal using a hobby iron, converted soldering iron, vacuum-pack food sealer or industrial-type heat sealer (like I use). You could probably even do it with Super 77 if you just felt like being different, but I wouldn't recommend it!

Ideally, the seal should be made with a lap seam of some kind or other - this isn't critical, though, and unless you're taping the pieces together it probably won't be too practical.

Okay, now that you have your giant sheet of film, you need to seal the two 24' edges together. Again, use whatever method works for you. Tape demands extra hands to hold the film, etc., but is the lowest-tech approach and works fine. When you have completed this step, you should have a large tube of plastic film that measures 24' long with a circumference of 55.5'. You won't be able to actually see this tube, of course, because the film will be all over your floor - but you need to keep the idea in your mind so that you don't get the various edges confused.

Next step, sealing one of the edges of the actual tetroon... It is as simple as sealing one of the ends of the large tube - just start at the seam that you just created and seal one of the ends all the way across (since the length of the original sheet is now folded in half, the length of this seam will be 1/2 the original sheet length or about 27.75').

At this point you have a plastic pillow case suitable for a Jack-and-the-beanstalk type giant. If you sealed off the other end in exactly the same way as the first, you would have created a "pillow balloon". This is a very simple shape but really has nothing to recommend it. It's so easy to improve on a pillow balloon - either by making a proper cylinder (albeit with a little loose fabric) or else a tetroon - that the pillow balloon really should remain an historical footnote amongst balloon designers.

Okay, how to make a tetroon? Just seal the remaining end at a 90 degree angle to the opposite side and you'll have it. That is, picture the pillow balloon (or a pillow case) with both ends closed in the same way (straight seals that are parallel to one another). Now imagine one of the ends sealed the "other" way - not parallel to the first side, but instead perpendicular to it. (Some people stumble here, but as soon as you see it you'll wonder how anyone can be confused!). If somehow you just can't grasp this, then go to the late-night drive-thru window at Wendy's and order a baked potato with sour cream. The sour cream packets at Wendy's - last I saw, anyway - are made the same way (though the dimensions are a little off and so the tetrahedron isn't regular).

Your basic tetroon is now completed. The final step in constructing the envelope is to cut the mouth and attach the load ring. First, decide on the size of the mouth (and thus the load ring). Note that I am only discussing the simplest possible arrangement here - the basic Sky Diamond design - and thus a rigid load ring is assumed. I usually use a full-size hula hoop (or dollar-store equivalent) for the load ring and these measure somewhere between 32" and 36". The mouth will be cut slightly larger so that no circumferential stress is created at the mouth.

To do this, lay out one of the corners of the envelope on your cutting surface (it needs to be rather large) and straighten out the film so that there are no wrinkles or folds. Now cut an arc equal in radius (from the corner) to the desired mouth diameter. For the basic Sky Diamond tetroon, I usually cut a 4' mouth. Note that a rotary cutter really comes in handy here - I just lay my measure down and mark the 4' radius every few inches with a permanent marker, then cut the arc out freehand using the rotary tool.

If you're using tape to seal the entire balloon, you could now just fold a cuff of 2-3" all around the mouth and tape this (very well!) to the envelope. This will form a sleeve into which the load ring (i.e.., hula hoop) can be slid. You'll need to make a slit somewhere along the sleeve, of course, to actually insert the ring.

If you're using a heat sealer or some other method besides tape, then you probably want to use a separate sleeve and attach it to the mouth. For the

academic SD design, I typically use HDPE garbage bags. You can cut the edges of the bags off in 3" strips and the existing fold (i.e., along the edge of the bag) will form the bottom of the sleeve. Heat seal or otherwise attach these sleeves (you'll need multiple pieces unless you're cutting the sleeve from a long roll of lay-flat tubing) to the mouth and you're done.

(Why use the separate sleeve? Because it is very difficult to ensure a strong seam when heat-sealing the very thin balloon material to itself... The film varies greatly in thickness along its width and the heat sealer will seal some areas perfectly and melt holes in others. This is fine for low stress areas of the envelope but results in catastrophe if it happens along the mouth.)

Last but not least, take the hula hoop apart (emptying any contents like beads or water) and slid it into the sleeve. Carefully poke a few holes through the sleeve - just above the top of the load ring (no longer just a hula hoop!) - and attach your suspension lines. Given a 1-2 kg payload, I would typically use 6-8 lines. I have used as few as four - this worked once and failed another time. More than eight and they're just getting tangled all the time. Make sure that these lines - once tied around the load ring - are equal in length and then tie them together. This is where your load line (to the parachute, payload, etc.) will be tied.

At this point, the envelope is complete. I usually don't add the solar absorber (tempera paint, in the case of the Sky Diamond) until I reach the flying field - it *will* leak out and get on your clothes, car, etc. and it can really make a mess.

Once you're at the launch site, take about four ounces of powdered paint and dump it into the envelope. Now gently pull, tug and shake the envelope to completely coat the inside with the paint. Four ounces is really too much, but you'll definitely have enough that way... So once the entire thing is coated (it will look grey instead of white), dump the excess paint back out of the mouth.

NB: You MUST use a non-flammable powder as your solar absorber! Using powdered charcoal or other potentially flammable substances can result in a MASSIVE explosion and cause severe injury and possibly even death! Think "grain elevator explosion" and you'll know what I'm talking about... I settled on tempera paint not because it was the best substance for absorbing solar radiation, but because it works good enough and is 80% calcium carbonate - and thus entirely non-flammable. DO NOT IGNORE this important matter or you will be risking life and limb - you have been warned and I cannot be held responsible for stupid decisions made by stupid people!

Ah, I feel better now... Where were we? The envelope is built, the rigging is attached to the load ring, the solar absorber has been distributed throughout the balloon and by now you've already attached your payload to the rigging. It's time to fly!

Look around you - are the leaves jiggling on the trees? Are there light gusts, maybe to five mph or so? If so, then you might be really sad in a

few minutes... I suggest bagging the balloon up again and waiting for an absolutely calm morning. A launch can be done in light winds, but you will need a very large field and lots of patience. A little Valium wouldn't hurt, either.

So let's assume that the conditions are just right - calm, cool (<20C), and with the sun up for at least an hour. (What's the minimum solar elevation by season to ensure launch of a typically loaded Sky Diamond? Beats me - but it would make a perfect science fair project!) The first step is to get air into the tetroon. You can use a leaf blower (be careful, though, or you'll tear a hole in the gossamer film), a household fan or you can simply do deep-knee bends while hold the mouth and thereby pump air into the balloon. My first launches all used a leaf blower - I now use the deep-knee bend technique almost exclusively.

If the conditions are really great (cold, calm air, crystal clear skies with no cirrus or haze), then you'll notice lift almost immediately. One of the corners of the tetroon will lift off the ground as soon as it has some air in it and the entire balloon will be airborne before it is even half full. Typically, though, it takes a little longer than this - but not more than a few minutes unless there is a breeze (and thus forced-convective cooling - a really bad thing for a solar Montgolfiere).

Once the balloon is in the air, hold onto your payload loosely and wait for the balloon to take it from you. As with all balloons, watch out for false lift (with calm conditions you won't need to worry). The ascent will be majestic and perhaps nerve-wracking for those familiar with latex weather balloon launches - it is VERY slow at first and will settle out around 300-400 fpm (I think I mistakenly said around 500 fpm at the GPSL conference). Again, you can see why wind is the enemy of solar balloons - my most recent Sky Diamond couldn't clear a 40' tree that was 75 yards away!

Peak altitude will take a couple of hours and descent will begin about 30-45 minutes before local sunset. If you let the payload just ride the balloon all the way down (which I always do), it should be on the ground about three hours after the descent begins.

A descent can be commanded (as Ron Armstrong, VE2JOR, has requested for his group's solar tetroon) by simply flipping the tetroon upside down. This is accomplished by tying lines to each of the three top corners of the envelope and securing these to the payload (usually via a single suspension line - it looks something like the crown line on a conventional hot air balloon). Descent is initiated by cutting the primary suspension and thus inverting the balloon. Note that you'll need to rely on your parachute to slow the descent if you choose this method. This extra line can also be used for ground-handling in light winds (like a crown line) or to abort a launch.

To those who may not be hams or are otherwise contemplating the free-flight of non-tracked balloons: Please don't fly one of these without a tracker of some kind. This is a large balloon made from non-biodegradable plastic film that can have significant impact on the environment if it is not retrieved. If you fly one, make sure that you can get it back! The liability that you

create is YOUR OWN and it could be massive - you have been warned (again).

Let me know if anyone has any questions... This was written in one session and not proofed, so there may be some things that make no sense at all - if you find something like that, please point it out. I will post an edited version of this message on my web site in the next few days.

Regards,
Robert

Subject: Solar Tetroon

Hi Robert,

I resent this in case you didn't get the first one.

Sorry to hear about the misfortune on Sky Diamond 9. Better luck next time!

Thanks for the very informative lecture at GPSL, it was very MOVING! :)
I didn't get a chance to speak with you while you were there. I am interested
in making a tetroon. Can you give me the basic dimensions/stats or any other info that might help. I would like to make one to lift about 3 pounds. I plan to
use the painters plastic & tempera paint as you recommended at GPSL.

I have a 4 meter solar balloon cut from plans on
http://perso.wanadoo.fr/ballonsolaire/en-index.htm
I haven't taped it together yet. I hope to do so soon.

Hi Robert,

Thanks for the very informative narrative on the tetroon. Since
I returned from GPSL I made a couple of paper tetroons and
a couple out of garbage bags just for practice. I will try to scale
up and get a big one ready.

As Forrest G. said, "I'm not a smart man" so I'm
headed to Wendy's for a baked patato. ;-) Maybe then I
can get a 2D to 3D conversion in my mind. ;-)

Oh, Harry (and Robert) thanks for the pictures and
URLs I've visited a few and checked Harry's picture
too.

I'm just having trouble converting the 2D images to 3D
objects in my head. I'm hoping the 3D sour cream
package will do the trick. Besides, it's lunch time
and the XYL (Cris N0XZB) won't have to cook. ;-)
Method to my madness. ;-)

Hi Don,

Don't feel bad, it took me 4 tries to get the model right! :)

If there is no overlap on the seams the formula
I used on an 8.5x11 sheet of paper for the width
was 11 / 2.3094 = 4.763" and follow the directions
here... http://www.flymetothemoon.com.au/homebuilding/solar.htm

Gluck!

Steve made a great page - I especially like the plug for my site at the bottom! =) He went through the same difficulties in understanding the shape and finally had to make one to see it (I suggested the Wendy's packet to him as well but I don't think they have them in Australia). After he understood the idea, he made that page and it is a wonderful reference.

I don't agree with all of his "rules of thumb" - e.g., the volume calculation is actually Prof. Huch's shortcut for doing the calc and Steve got that from Don Piccard. It's close, but if you're using a spreadsheet to do the calcs there's just no reason to use it. Back in the days of sliderules it made sense.

Note that the "2.309..." term is actually four over the square root of three - in case you were wondering!

Hi Hank,

I've got LiftWin 0.41, and the set profile feature is still under construction in that version. Is there a newer one out there now?

BTW, Liftwin hit our numbers re ascent rate right on for GPSL 05, but predicted a bit higher burst (that's very unit-specific!). Keep up the good work, and drop by GPSL sometime, eh? It's a real gas ...

Hi Zack,

I think FD happens on the last weekend of June, which would be 24 Jun 06.
The Sunday prior, 6/18/06, is Father's Day, which may be an issue for some attendees (not me, tho).

I'd like to get GPSL 06 on the calendar PDQ, before Colo Space Grant posts its reservations for next year.

And thanks again for stepping forward to coordinate this burgeoning event!

Date: 2005-07-10 23:38:00 UTC
From: Mike Manes
Topic: 1502 Message: 1514

Hi Robert,

Hey, thanks for that detailed description!

One question that came to mind during your presentation at UNO, (but lost
during our slow merry-go-round ride!):

Where do you locate the center of the circle that you cut for the load ring?

And I'd like to add some emphasis to your caveat re recovering the balloon: livestock, especially the ruminants that supply Big Macs, can be killed by eating that film - it binds up in their GI tract.

Bad news for the cow, but pretty nasty for the club if they get hit for a bill for the beef on hoof!

This is why EOSS always attaches a separate beacon to its plastic balloons, even tho we cut it away from the payload string.

If EOSS >every< finds itself fortunate enough to experience a Sat AM with zero wind (very rare!), we may try it!

It was that last seam, "90 degrees perpendicular" to
the other. That just threw me,no reason it should
(except as I said in the first email "I'm not a smart
man", at least not know, if I ever was). I was also
trying to remember that darn package of sour cream
from Wendy's. I knew I had seen it before. It just got
real murky for me. ;-)

While Cris was driving us to Wendy's I read it
out-loud (always helps) and she got it right off. They
she was trying to explain it to me too.

Unfortunately, we didn't make it to Wendy's we got a
call from my Mom and ended up running to the hospital
(dad's been in and out for the last few weeks, this
time in since last Thursday). But I did get a lot of
quiet reading time in the waiting rooms while he was
in being worked on.

Thanks everyone for the help. I hope to have a model
put together tonight.

Seam Sealing

I was playing with some .5 mil plastic and a "Global Custom Sealing Iron" without a cotton sock. The iron is used on R/C aircraft covering. I was using it to try to seal the seams on the plastic. The temperture control is too course. It's either too hot or just not quite hot enough. Other than buying a seam sealer, like Robert has, tape seems to be the way to go. The big problem with tape is STATIC. As the tape nears the plastic, the plastic will jump up and attach itself to the tape, and 99 times out of 100, it will not be where you want it.

Some of you vinyl record buffs may remember a device that looked like a small pistol that was used for static neutralization. Mine is called a ZEROSTAT and was distributed by DISCWASHER. On the pull of the trigger it discharges ions of one polarity and upon release of the trigger it discharges ions of the opposite polarity. At least that's the way I understand it's operation. Static is then eliminated!
I will experiment with this further.

Static - that's why I said that tape needs more people! :D You need a couple of people to hold the film in place and then one (or more) to apply the tape.

The hobby iron will work with 1/2 mil poly. Just put a sheet of copy paper (plain old 20 lb bond) over the plastic and iron over the top of it. My early solar balloons (at the bottom of my web page) were all built this way.

Keep working on it and good luck!

1520. Finding the mouth RE: [GPSL] RE: Solar Tetroon

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-11 03:12:14 UTC
From: Rochte, Robert
Topic: 1520 Message: 1520

I guess my spam filter swallowed the first copy of this message - sorry for not replying earlier.

It's very simple. Each of the end seams that you make (those which are at 90 degree angles to each other) will form edges of the tetroon. The other edges are harder to determine without inflating it, but can be determined through careful (and rather difficult) measurement.

Given that both of those seams will form edges - and an edge must end at a vertex (which is what we're trying to find) - just spread the envelope out on a large floor, straighten out the film near the end of one of those seams and a nice triangular end will appear. That's one of the vertices of the tetrahedron and as good as any other for the mouth. Measure, cut, seal and you're done.

Let me know if that's not clear.

Regards,
Robert

1521. RE: [GPSL] RE: Solar Tetroon

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-11 03:24:03 UTC
From: Troy Campbell
Topic: 1502 Message: 1521

Don't you need the static for the thermal energy
absorbing material (the finger paint)? Will
neutralize the charge prevent the powder from sticking
to the inside of the tetroon?

(Just a question).

Troy, KC0MIC

1523. CAPNSPACE GPSL Flight narrative

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-11 09:59:43 UTC
From: kc0mic
Topic: 1523 Message: 1523

The following is rather long but I'm posting it at Mark's urging.
(That's right, I'm going to blame it on Mark).

The recap, stats, data and pics are at:

http://www.capnspace.org/Missions/?dir=cns-003a

73 de Troy KC0MIC

CAPNSPACE (Civil Air Patrol Near Space program) CNS-003a

We had 3 'firsts' this year.

1) This flight marked the first flight made at a GPSL. Last year we
were observing at GPSL-2004 in hopes of starting a program.

2) This flight marked the first flight CAPNSPACE made as a member of
the Near Spaces Ventures, group. In conjunction with that, we
worked with a BSA venture group.

3) This flight marked the first flight that we recovered without any
'outside assistance' (ie the farmer didn't find it before we did
and call us.)

LAUNCH:
At 7:00 we arrived at Traynor high school and began setting up.

The winds were still light and it was about 70F.

After another group had began to fill their launcher (balloon), we
noticed that the wind was just starting to pick up and decided that
we'd fill our balloon and be ready for launch should the wind start
to pick up any more.

It was decided that we'd put in more lift the we normally would to
get the package out of the ground winds and past 40,000ft quicker
than normal.

We launched at 8:10am CDT about 5 minutes after the first launch.
The climb rate was about 1,100 fpm. (That is an estimate until the
data from the flight recorder can be analyzed).

We packed and split into three teams and left the launch area right
after 5 more groups launched.

TRACKING:
The APRS telemetry showed that the flight path was following the
flight projection fairly closely.

Almost immediately after takeoff, the tracking system froze up for chase team 1. Team 3's tracking equipment never did work. Team 1 rebooted and got some limited functionality for maps and vehicle location but the KPC 3+ TNC stopped working altogether. Chase Team 2's equipment was working perfectly.

At this point, Team 1 and 2 departed east on highway 92 to highway 71 to stay ahead of the balloon. Team 3 remained to try to get the tracking system working. The 2m simplex repeater on-board the spacecraft worked great so all the teams stayed in contact .... up to a point....

The spacecraft is equipped with an ELT on a practice frequency of 121.775mhz. Every 5 minutes the flight control computer would turn the ELT on for 1 minute. When the spacecraft neared apogee, the flight controller latched the ELT on so that it could be tracked on the way down.

The problem was that the ELT would modulate the 2m simplex repeater. We still don't know if the issue was the proximity of the antennas or if the ELT or 2m transmitter need to be shielded or both or all three. In any case, when the ELT latched 'on' the simplex repeater became pretty much useless. It would still key-up but whatever voice traffic was on it was drown out by the ELT. Because of that Teams 1 and 2 lost contact with Team 3 about an hour into the flight.

Team 2's (Keith Kaiser, WA0TJT and Deb Kaiser) tracking equipment was still working fine so Team 1 (Troy Campbell, KC0MIC and Cindy Campbell, KC0RRW) stayed within simplex range and both teams stopped just outside Grant . The balloon had pretty much stopped forward motion over Elliot and climbed to 95,082 feet and burst just a little west of Elliot. What was interesting was that if you keep the meter on the ELPER 'centered' you could get a fair sense of the elevation as well as the direction. The DFing fixes agreed with the APRS data, which was gratifying. I was worried that we wouldn't be able to track it with only one set of APRS equipment. The ground teams departed for a position between Elliot and Grant.

RECOVERY:
Keith on team 2 had binoculars and spotted it at about 3,000 ft after it had passed over us but lost it over a hill. The last APRS posit was from 2,400ft at a little past 10:00am CDT. We made for that spot. Team 2 was already there and searching a corn field (Iowa = Corn, probably should have guessed the landing obstacles). Joe Lynch, N6CL, editor of CQ-VHF was on the scene also to help search.

After a bit of that, I broke out the 'ELPER' and took a couple of fixes on the ELT. It was still strong showing the signal coming from further north but basically straight up the road. If you look at the track from the APRS data you'll see that the package flew up the road and landed within 20 feet of it. Unfortunately, the corn

was taller than I was and the fence propagated the signal in many wonderful ways.

Even though the ELPER was pointing to the package correctly the terrain was very hilly with intermittently spaced tree lines, creeks and terrace ridges. The owner of the farm arrived about midway through the search and attempted to help from the top of his almost 2-story harvester but it was on the ground in the Tall Corn and just couldn't be seen.

After about 2.5 hours, we'd isolated it to a 50ft patch of corn using an aircraft radio and 'body nulling'. When I couldn't get a null any longer, I took the antenna off the radio, held it away from me and parallel to the ground and started walking the rows till the signal indicated I was within a few feet of it. I literally tripped over the package.

It was 12:30 CDT now and everyone was hot, tired and hungry. Team 3 (Mike Hackley, KC0SGD) arrived while I was searching around the corn field. After we'd recovered the near-spacecraft, Mike and I shut everything down, retrieved the flight recorder, the RAM card from the digital camera and the film from the film camera.

The digital camera looked like it impacted something pointy and we had to pry the RAM card out of it. The camera will have to be replaced.

We drove back toward Omaha stopping at 'The Rose' family restaurant in Traynor.

Things we learned and that need improvement:

RECOVER OPERATIONS:
The ground tracking equipment in the chase vehicles needs to be 'hardened' and tested.

We need to practice as a team more. When the teams become separated, common frequencies and contact procedures need to be used.

Standard DFing procedures need to be documented and practiced.

Several other 'standards' need to be discussed. Simple things like "What notation should everyone use for Latitude/Longitude?"

FLIGHT OPERATIONS:
An additional crew is needed for coordination of the flight phase, from launch to just after burst.

When we launch a package for a group or specific science or instrument package (ala the 2 meter simplex repeater) a person dedicated to controlling the package needs to be on the team. For example, the 2m simplex repeater was enabling contacts in Champaign

Illinois and Independence Missouri but there was nobody to log the traffic.

LAUNCH OPERATIONS:
This went pretty smoothly except that while we had decided to use more lift that we normally would, we used too much. We'd wanted 2.5 lbs and ended up with 3.8 lbs. We need to add a check list for the launch vehicle (balloon) similar to the payload power-up and attachment checklist.

While we want to encourage visitors and participants, there is a time when it would be real useful to have a "sterile" launch area. (This is also a safety issue.) Stanchions and tape or orange rope might work.

ENGINEERING:
The CAPSTAR-1A near-space frame is nearing it's end-of-life. Its getting pretty beat up. Another 1 or 2 frames need to be built and readied to fly.

The RF crosstalk between the ELT and the 2meter FM rf sections needs to be addressed.

A commanded cut-down device needs to be installed so that we can fly larger payloads.

GPSL suggestion.
GPSL-2005 was Great! Mark Conner, N9XTN, did a super job pulling it all together. The conference topics and speakers were VERY interesting and informative. There were ten balloons launched and over 65 people attending. It was great to work with everyone I'd met last year and meet new groups.

I did hear a good suggestion that at the next GPSL there be a "net control station and operator". The controller's job wouldn't necessarily be to coordinate a net. (There was very little congestion on the local repeater). But the controller _could_ facilitate communication between different groups when, for example, a group needed help with recovery operations or they wanted to cross check their own tracking with another group.

1526. Equipment needed to track the balloons in the field?

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-11 16:18:37 UTC
From: Jim
Topic: 1526 Message: 1526

Group,

I am fascinated by the tracking of the balloons and want to get
actively involved in the tracking.

Questions - What equipment do I need to track the balloons?

1. I have a Toshiba laptop running Windows Xp. Pentium 4

2. Considering the purchase a TM-700A dual band radio

3. Have a 70 cm handheld W 32 A

4. 2 meter mobile rig and dual band antenna.

5. Have a Garmim GPS 12 GPS unit I use when hunting and Geocaching.

What else do I need? Software etc... and recommendations and an
ELMER I can call upon for assistance.

I believe I need a GPS unit with data ports running maritime protocol.

Tnx in advance:

Jim N0AJI

Kent W9KAO,

I can't seem to get mail through to you for some reason.
It keeps bouncing back so I will post it here.

Once again I would like to thank you and your family
for all the help with the ORB-18 flight. It was nice
to meet you all and run around the countryside together.
I hope you had a safe trip home.

I forgot your younger son's name and I also forgot to
write it down. I am putting a few pics on the web site
and I need his name for it. I met so many new people
I'm having trouble remembering everyone. Did you also
have a daughter along? I may be confused as usual! :)

Thanks for the log. I do appreciate it!

Jim,

My favorite software is UIView interfaced with Under Tow software Precision Mapping v6.0. If you hook your GPS up to the D700, UIVIEW will redirect the GPS information to the mapping program and you will be able to track both the balloon and your location at the same time. Any GPS outputing NMEA will work.

If you have any questions you can reply through the group or directly to me at kentochs@...

Hi Jim,

sounds like you have most of the tools required to track a balloon, some are using UI-view and precision maps and some are using APRSplus SA(Street Atlas 7,8,or 9 Street Atlas will not support any newer versions. Make sure that you have radio direction finding equipment, like a good yagi and attenuator and the knowledge to use it practice practice practice! DF'ing has saved EOSS's bacon on many occasions. What state are you in? There are many groups in the country that do this stuff and it might be good to visit one of their launches and talk first hand to the recovery crews and see what they are using. As for EOSS we would love to see you at one of our activities, and I know that any other group would like to have you visit and pick their brains too!
Chris kb0yrz

Jim:
My favorite set up is the one I have: Kenwood D7 HT interfaced to older Garmin 12XL GPS unit, with a 19" whip on the roof. Using this set up alone, I've tracked many EOSS and "ES-OS" balloons and gotten video of the payloads hitting the ground. This set up really comes into it's own out in eastern Colorado 'mile square farm grid' dirt roads as a ground borne ham can have excellent mobility with grid roads. I usually suppliment it with a co-driver with their nose in a map, but I tend to drive faster than most of them can read the map. Anywhere without grid roads and the more advanced set up with moving map display will have a big advantage.

Chris is absolutely right- there is no substitute for DFing, and I would add 'optical DFing'. Bring a youngster with 20-20 or better vision. They'll have a blast, and in good conditions you can (and I have) optically tracked balloon payloads down to the ground.

It's a lot of fun- good luck!

1533. Re: [GPSL] Re: Equipment needed to track the balloons in the field?

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-13 08:35:10 UTC
From: wb8elk@aol.com
Topic: 1526 Message: 1533

I currently rely on a Kenwood D700 with a Garmin 35 GPS on the roof....while a moving map display is nice, it's difficult to mount a laptop in my little Sentra and if it's just me tracking it's virtually impossible to drive and look at a laptop map, I just rely on the handy dashboard display on the D700 that tells me just how far away I'm from the descending payload and also the speed and heading of the payload as well all on one screen. Before a flight, I usually run the descent profile on Balloon Track at several altitudes to give me an idea where I should be in relationship to the payload as it comes in and refine my position near the end with the realtime data on my D700 display.

Without a laptop map display, I can usually see the parachute coming in near me. I do occasionally stop and glance at a DeLorme book map of the state to see what roads will get me where I need to go (provided they have one for your area).

You can do the same thing with the Kenwood D7A but the D700 gives everything you need on one large display screen and that is very convenient as the payload is about to land and you have to make some quick decisions.

As those who recently attended GPSL in Iowa, finding a payload (even when it's telling you it's GPS coordinates) is nearly impossible in a cornfield unless you augment the search with DF equipment or get lucky enough to trip over it (how we found our payload). Arrow Antenna makes some nice handheld antennas that are easily disassembled....also there are plans out there for making a dual-band DF antenna with tape measure tape that works just great, is flexible and survives even the worst cornfields, brush, etc. Since my HT has an SMA connector on it, I buy the very compact SMA barrel attenuators (got mine very cheaply at DownEast Microwave on their surplus page) and just screw then onto the HT as I get close-in....this is a necessity when using signal strength DFing even with low power beacons. I usually keep a 10 dB and a couple of 30 dB attenuators in my shirt pocket and often use them in series as I get close.

The best portable DF unit I've used for balloon tracking is a circuit designed by Paul Bohrer W9DUU which I published in the July 1990 issue of 73 Amateur Radio Today magazine....it's called the "Foxhunt Radio Direction Finder"....I just love how this unit performs....some companies sell similar versions (Ramsey, for example) but they don't have as many neat features as this particular one. It's based on an H-frame set of two vertical dipoles and works on the phase difference of arrival to the two antennas. It has a left-right meter, left-right LEDs and also gives you a left-right high/low tone....You can literally walk right up to a 100-watt transmitter without using attenuators with this unit.

Since 73 is now defunct, I'll scan the article in and post it on my website (www.wb8elk.com) if anyone is interested in building one. I believe that FAR Circuits may still offer circuit boards for this article and I'm thinking of

redesigning it with a smaller PC board so it can be mounted more easily directly on the H-frame antenna. I'm going to be making some boards up for our local group before our next series of student flights, so I'll post the board files on the website when I'm done with it.

Topic: 1526 Message: 1534

There was an even simpler unit I built based on a 73 article from around 1994 or 1995. Instead of an H shape, the antennas looked like a bowtie. You rotated the unit to produce a null in your receive signal. However, there was a front and back null, so you had to resolve the 180 degree ambiguity yourself. Parts were maybe $5 plus the board. I've never used the W9DUU board as a comparison, but this unit worked pretty well.

I used to chase solo with a laptop, but it was a real pain. Plus it was a little dangerous to have your eyes off the road so much. I find having a laptop with detailed maps available makes the chase go a lot better. Even with a good road grid, you'll find rivers w/o bridges, dead ends, and so on. Having a driver while you work a laptop is the optimum solution in my opinion. Otherwise, a D7/D700 feeding received posits to a GPS is good for solo chasing.

1535. equipment needed to track.... D7 versus D700

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-13 17:27:30 UTC
From: K. Mark Caviezel
Topic: 1535 Message: 1535

Bill raises a good point - laptops in cars - although many hams do it well, do impact vehicle usability. Many of the EOSS core trackers allocate the front passenger seat for laptops and any passengers or riders are relegated to the back seats. No big deal, but some people are a little funny with that.

And although it's common with laptops to crash and reboot, something like the D7 or D700 has a much more robust software set, eliminating time consuming reboots while balloon is making 2000+ foot per minute descent.

(from Bill)
> As those who recently attended GPSL in Iowa, finding
> a payload (even when
> it's telling you it's GPS coordinates) is nearly
> impossible in a cornfield unless
> you augment the search with DF equipment or get
> lucky enough to trip over it

ng0x response:
This is one aspect where the QRP/battery powered set up I run has an advantage. The D7A loads the waypoint into the Garmin 12XL. The Garmin 12XL vector finds with 0.01 mile resolution (minimum distance differential displayed in miles). I either take the GPS/HT aggregate with me, or just take the GPS unit. With constant updates on the handheld GPS unit, I'll get MUCH closer than someone who dead reckons from their car parked on the side of the nearest road. Although I've had many many people tell me about inherant GPS inaccuracies, I ascert that it is 'parking space accurate' as it will get you back to the exact same parking space that you took a waypoint from. There is a noticible difference if you are one parking space to the left or right of the original one. Now, the APRS beacon on the payload may have stellar or substellar accuracy depending if it lands face up or face down..... just another one of the interesting characteristics of this hobby.

Hi Harry,

Yeah, "static cling" with scotch tape can mess up a lot of stuff - even
with graphic layouts, etc. I found that one can kill off the static
simply by exhaling on the tape - works like a charm. Betcha a
vaporizer would do a creditable job as well for the big jobs.

Thanks Mike!

How many breaths would it take for 200 ft of tape?
A vaporizer sounds better than hyper-ventilating!

:)

Hmmmm .... I can do about 2 ft per exhale ... so about 100. At
a tidal rate of 20/minute, that's about 5 minutes of normal breathing.
How fast can you lay down 200 ft of tape?

But yeah, a vaporizer, or a bunch of excited kids, might make that go
a bit easier :=}.

1543. More GPSL 2005 pictures needed!

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-18 00:01:43 UTC
From: Mark Conner
Topic: 1543 Message: 1543

We've got a fair collection so far, but can always use more pictures from GPSL 2005! If you would like to contribute, you can do so one of two ways:

1) FTP your pictures to capnspace.org (no www or ftp in front).

Userid: gpslftp

Password: gpslftp

If you are using Windows, try placing ftp://gpslftp@... <ftp://gpslftp@.../> in your browser and fill in the password at the prompt. A regular FTP client may work better.

2) Send your CD of pictures, video clips, etc., to:

Mark Conner

907 Thurston Ave

Bellevue NE 68123-2452

3) E-mail your pictures to n9xtn@... . I can receive a max of 5 Mb per e-mail and have a 100 Mb box.

Hi Mark and Troy,
Thanks for the site. I popped some images up there today. If you need higher resolution, I have them in about a 3 MB size, let me know. Other EOSS folks may contribute also.
- Marty

From: GPSL@yahoogroups.com [mailto:GPSL@yahoogroups.com] On Behalf Of Mark Conner
Sent: Saturday, July 09, 2005 1:03 PM
To: GPSL@yahoogroups.com
Subject: [GPSL] FTP server

Thanks to Troy KC0MIC of CAP-N-SPACE, we now have an FTP server for uploading GPSL 2005 materials.

Site: capnspace.org

User: gpslftp

Password: gpslftp

Please make a subdirectory with your group name or callsign under the main directory before uploading your files. You can make any subdirectories under your own directory too if that helps to organize your files.

Anyone having pictures or video clips, regardless of whether you're associated with a balloon group or not, please contribute to our GPSL 2005 proceedings CD/DVD.

Some of you have already sent me a CD - if so, you don't need to upload those pictures.

If you would prefer to send me a CD because you're on dial-up and don't want to spend time uploading a large volume of data, you can send me a CD with your pictures at:

Mark Conner

907 Thurston Ave

Bellevue NE 68123-2452

1555. Digital Camera

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-25 03:36:16 UTC
From: w5bl
Topic: 1555 Message: 1555

Can anyone share their experience with flying a digital camera on a balloon package? I am preparing a package to fly on the upcoming NTBP flight and I have some extra mass budget that I want to use to fly a digital camera. I have looked at a couple of different cameras to attempt to modify by adding a timer to trigger the camera in flight but the cameras I have looked at are not easy to work on. If someone has experience flying a digital camera I would appreciate the details of what model was used and how the images turned out.Thanks in advance for the feedback.

73,

Doug Loughmiller, W5BL

From: Don KA0JLF
Topic: 1555 Message: 1557

We took a bit of a different approach at GPSL 05. This year we flew a DVR (which also has a digital camera mode), and just captured video. It worked well. The DVR is around $100 at Walmat. It uses a SD card, with a 1GB SD card we get over 2 hours record time (full flight).

There is a PDF file on our web site by Dave Harper. He did some interesting studies on cameras for his flight. There might be some useful info there, not sure they were digital, memory fails me right now.

Doug:
A few thoughts:
a). film works great, unless you let it get REALLY cold. With so many people going to digital now, the possibility of getting a pretty nice 35mm camera for free or close to it are pretty good. I've flown Olympus Stylus 35mm cameras with great success. (modification for electrical triggering is pretty easy.) Low cost parts for balloon payloads are good, it is a hazardous occupation for hardware.
b). Some cameras, including the Samsung 777i 35mm camera already have a timer built in. It will take pictures on ten minute centers.
c). Even more fun than a timer triggered camera is a remote commanded one. I've flown a radio triggered camera many times on ES-OS and EOSS flights with great success. This will allow you to take tons of photos above 90k feet, instead of having just one or maybe two.

have fun with it!

1560. RE: [GPSL] Digital Camera

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-25 20:37:27 UTC
From: PAUL VERHAGE
Topic: 1555 Message: 1560

You'll want a camera with auto focus feature. It appears that the cameras that are focus free are preset to a short distance, like 20 feet. Needless to say, there ain't nothin' 20 feet away in near space.

I found a 2 megapixel camera at Walmart during GPSL that I have tried to mod. I haven't flown it yet, so I can't tell you how well it will work.

One of these days, I'll start a webpage of sucessful camera mods.

The one problem to look out for is the power save feature. For some reason, engineers think I can't turn off the camera when I'm done. I've seen cameras shut off before the timer takes the next picture.

A good film camera is the Canon Elph.

I like the camera with built in timers. I'll have to try Mark's recommendation.

1563. Re: [GPSL] Digital Camera

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-25 23:24:53 UTC
From: Rick von Glahn
Topic: 1555 Message: 1563

Way back in September of last year I purchased a Canon Powershot S70. It was to be my pocket camera and also a digital camera EOSS could fly. The camera is sort of a running joke at EOSS meetings. I was supposed to build the housing to contain it and never seemed to get around to it. Now at each meeting I'm asked of my progress towards this goal. :) One of these meetings I'll dazzle 'em and produce a working payload package. That's because a volunteer came forward and offered to not only package up the camera for flight but also look into the possiblity of building a controller to manage the camera in flight via its USB port. He even has the API from canon to look into it. Well,.... why this camera?

The camera has a very wide angle lens, 28mm in 35mm film equilivents, and an INTERVALOMETER which you can set to just bang away taking pictures. For some reason that is totally beyond me, the camera is limited to 100 photos in the intervalometer mode so it wouldn't last a full flight in the once a minute setting. But, once every two minutes would work. It's a 7 megapixel camera and it is expensive. It's still expensive after almost a year on the market. But, it might do a good job if you're looking for something that requires no heavy duty building and programming.

You can set the camera to focus on infinity, force maximum lens apature to generate the fastest shutter speed. And the camera will remember the settings if you memorize them to a special spot in its mode selection system. So, it is fairly easy to setup the morning of the flight. The only problem, you have to delve into the menu system to start up the intervalometer. It would have been nice if that could have been programmed too so you could literally turn it on and be assured it would work properly during the flight. But with having to enter into the menu system, it remains a payload that requires a trained operator to get up and running prior to launch.

Rick

Dave Harper did all the work, he just let us post it
on our web site. I think he did an outstanding job!!!
Thanks Dave!
I was just happy to have found it. I don't remember
the details but I think he may have found us, or at
least visited. Getting old and forgetful is the pits!
;-)

Thanks for the kind words, even if we didn't deserve
them. ;-)

1565. More on digital cameras for balloons

Yahoo group: GPSL (2002 — 2008)
Date: 2005-07-26 03:44:17 UTC
From: Mark Conner
Topic: 1565 Message: 1565

Found this article while Googling for something else. It's the story of how a balloon group recovered data/pix from their SD cards after prolonged exposure in the Pacific.

http://www.letsgodigital.org/en/news/articles/story_3655.html

NSTAR uses a Concord 4060AF camera, which is 4MP. The quality is not quite as good as the Canon Elph LT I used to use, but the big advantage is the ability to shoot a lot more pictures. I'm willing to trade some quality in order to get the opportunity to take a lot more shots. Many of them are redundant and don't make it to the website, but I think I get a few that I might miss with a limit of 36 or 40 film shots. There is a web page by Kyle KB5TSS on how to modify it, but I can't find the URL right now. I believe the camera is out of production but I've seen it in recent months on sale for about $100. Check www.nstar.org <http://www.nstar.org/> for our late 2004 and 2005 flights to see how well it works.

I saw over the weekend that Wal-Mart has some cheap 2MP and 3MP cameras in the $40-$70 range that might be worth checking out as payload cameras. Should be simple to modify.

The one mentioned by HABITAT is another interesting choice for video. If you want full-motion video you're limited to something like 352x240 pixels - 640x480 is 10-15 fps which can look a little jerky when the payload is spinning. It's also a 4MP still camera and the cost is right around $100.

Found this article while Googling for something else. It's the story of how a balloon group recovered data/pix from their SD cards after prolonged exposure in the Pacific.

http://www.letsgodigital.org/en/news/articles/story_3655.html

NSTAR uses a Concord 4060AF camera, which is 4MP. The quality is not quite as good as the Canon Elph LT I used to use, but the big advantage is the ability to shoot a lot more pictures. I'm willing to trade some quality in order to get the opportunity to take a lot more shots. Many of them are redundant and don't make it to the website, but I think I get a few that I might miss with a limit of 36 or 40 film shots.
